Of the many varieties of physical therapy, active exercise probably deserves first place because of its wide applicability and because it calls into play the entire neuromuscular units in a manner approaching normal physiologic action.

SLING SUSPENSION EXERCISES

Some ten years ago I described the "sling suspension" method of exercise as an aid in restoration of muscle power in infantile paralysis. The method has been employed for this condition ever since and has also

been found useful in many other conditions. Briefly, the method consists in supporting the arm or leg to be treated in a sling suspended from overhead, thus eliminating the weight of the extremity as a hindrance during movement. The adaptability to the upper and lower extremities, as well as the fact that the method can readily be taught to nurse or mother, makes further mention of the method worth while. These exercises are helpful in allowing the patient to translate even minimal and scarcely appreciable muscle power into

Fig. 1—Sling about ankle to allow flexion and extension at the knee, the hip being fixed in extension by patient or instructor. With an additional sling about the knee and releasing the fixation at the hip the patient may execute movements in flexion and extension of the hip and knee simultaneously.

active and readily demonstrable motion through a fair arc. The fact that even slight gains are recognized by the increase in range of motion is of great importance in spurring on the instructor and the patient to continued efforts in the long and tedious process of restoration of muscle power.

The method is so simple that it can be employed to advantage in the case of even very young children. Resistance may be added, as indicated, in carrying out the exercises.

It is well at the outset to have the power of the muscles, or muscle groups, of the upper and lower extremities charted, the values being roughly estimated on the basis of 100 per cent, or listed respectively as normal, good, fair, poor, trace and zero, so that on comparison, at suitable intervals, some information may be obtained as to the rate of progress or perhaps cessation of progress.

If, after a period of gradual improvement, the condition remains stationary for a period of six months or more, it is reasonable to assume that no further note-

Fig. 2—Patient on the side to allow flexion and extension at the hip, the knee being splinted to prevent buckling.

worthy improvement is likely. Continuance of efforts under such conditions is not likely to be rewarded with marked benefit.

After it has been determined which muscles are to be exercised, the mother or attendant is instructed in the proper arrangement of the slings and overhead supports, and in carrying out the exercises as prescribed for the individual patient. The physician, or physical therapy technician, if one is available, should have no difficulty in a few short interviews and demonstrations

in teaching the mother or nurse the maneuvers necessary in the particular case. Occasional checking and supervision of exercises by the physician are desirable.

In the average case of infantile paralysis, because of the long duration of treatment, it is not practicable to have the child brought to institutions daily or several times daily for treatment by skilled physical therapy technicians. Neither is it practicable to have the skilled workers visit the children in their homes as often as treatment is indicated. The solution for the case of this type lies in the enlistment of the services of some one in the household, usually the mother. Exercise periods, for the most part, should be brief to avoid fatigue, but they may be, and usually should be, repeated frequently during the day, with proper rest periods intervening. The mother therefore is the one logical person to carry this out. I have found that the average lay mother requires but a few practical lessons in order to acquaint her with the relatively small number of special procedures applicable in the case at hand. She can be taught to carry this out fairly satisfactorily, even though she does not understand the physiologic

Fig 3—Sling about ankle to allow abduction and adduction at the hip

Fig 4—Patient lying supine with the sling about the wrist allowing abduction and adduction at the shoulder

principles involved. Such a program of course, requires occasional supervision and correction of errors, and also modification from time to time.

In the case of the lower extremity the use of the roller skate, ball-bearing device attached to a shoe has been found an advantage in facilitating early motion. This contrivance has been found very helpful in fractures of the lower extremity. With the ball-bearing under the heel and the lift under the knee, regulated by the patient himself, the gentlest movements in flexion and extension can be executed, just as much assistance being given as the case may require and without danger of injury, if ordinary care is used. Resistance in the shape of push and pull by the mother or attendant may be added. This arrangement provides for flexion and extension of both knee and hip as well as for abduction and adduction of the hip. Abduction and adduction are provided for by turning the wheels, fixed to the shoe, at right angles. This type of exercise will be found useful in practically all types of fracture of the lower extremity, including especially fracture of the patella and fracture of the neck of the femur where special care is indicated. There is prob-

ably little doubt that some potentially good results, after fracture of the neck of the femur, are ruined by too early removal of apparatus in bed. The strain at the fracture site, from the constant tendency of the thigh and foot to rotate out, represents a force that probably results frequently in a gradual giving way of the soft callus, with the result of a fibrous union. The directions to move the leg in bed in the sense of abduction and adduction, or, worse still, to try to lift the heel from the bed with the knee extended, cause tremendous force to come into play, which tends to angulate the neck into a position of *coxa vara*. In a leg slightly edematous, still greater caution is indicated because of increased weight. This internal stress on the bone, due to muscle pull, is very considerable, as Carey has demon-

Fig 5—Patient in sitting posture with sling about the wrist the elbow being splinted to prevent motion at this joint the arm may be swung forward and backward from the shoulder

strated. It is more than likely that attention to details of this character would help cut down the percentage of failure in fractures of the neck of the femur, and to reduce the healing period in this as well as other fractures of the lower extremity.

Other conditions in which sling suspension may be employed with benefit include spastic paralysis, especially of the lower extremities, and atrophic arthritis, as well as in cases of weakness and stiffness after fracture or injury. In spastic paralysis it has frequently been found of advantage to attach a heavy weight to the sling, transforming it essentially into a pendulum with heavy weight. The patient's arm or leg is placed in the sling and the pendulum is put into motion by the instructor, the patient being taught to continue the swinging with and without resistance. It is felt that a good start may be made in this manner in developing the sense of rhythm and in the teaching of gentle coordinate movement.

In arthritis, active motion within the pain-free range is without doubt a factor of considerable importance in the maintenance of normal physiologic joint activity. The alternate contraction and relaxation of muscle groups and their antagonists must be of help in improving the circulation. As the muscles contract, the lymph vessels and veins are compressed, the blood and lymph being hurried in the proximal direction. As the muscles relax, these vessels are filled from the capillary side, the capillary system in turn drawing on the arterial supply. In this manner capillary stasis is overcome, and definite acceleration of the blood stream results.

Fig 6—Patient seated with arm at the side the wrist again supported with the sling to allow rotation movements at the shoulder

All the tissues of the part, including those of the joint, are benefited by the improved circulation. Cell growth, repair and defense, as well as elimination, are enhanced. It is felt that the use of the ball-bearing apparatus in atrophic arthritis is of special value, since, with the apparatus in place, the patient can exercise frequently for brief periods, always in the pain-free range. Practically all the joints of the lower extremity, and those

of the upper extremity as well are brought into play, the latter through the rope and pulley hand control.

Fig. 7—Patient seated with arm abducted to horizontal level the sling supporting the wrist allowing flexion and extension of the elbow

UNDERWATER EXERCISES

Of perhaps equal importance as an aid in muscle training are underwater exercises. While suitable for infantile and other types of paralysis atrophic arthritis, and weakness and stiffness of the extremities after injury, this type of exercise will be found

useful as well in many instances in the field of internal medicine, neurology and psychiatry.

The advantages of underwater exercises are that (1) the buoyancy of water eliminates gravity and (2) the warmth of the water relaxes the muscles and accelerates the blood flow. The steady, gentle resistance of the water is readily overcome even by feeble muscles. The degree of resistance varies with the speed of motion.

The large pools, indoor and outdoor, are used mostly in the treatment of infantile paralysis and spastic paralysis. The most desirable temperature for infantile paralysis is about 91 F. For spastic cases a slightly higher temperature, about 95, is desirable to produce greater relaxation. It is doubtful whether the great sacrifices, financial and otherwise, made in many instances to provide pool treatment are justified by the results. The ordinary tub or small home-made tank in the average home will answer very well except in unusual cases. They have the advantage that the temperature can be regulated to suit the individual and that the water is renewed for each bath.

While the best results can probably be obtained by specially trained instructors, it is believed that the physician or competent physical therapy technician can teach a mother or attendant the necessary exercises in the individual case with a minimum of expense and with results that will probably compare very favorably with treatment in the large pool.

I have found the so-called Hubbard tub,¹ which is finding favor in many hospitals, of great help. I would be loath to do without this important part of physical therapy equipment. Such a tub installed in a room in a general hospital will be found very helpful in all cases in which wide abduction movements of the arms or legs are very desirable.

OVERHEAD TROLLEY SYSTEM

By means of an overhead pulley, the patient is gently hoisted on a hammock from the bed and carried by trolley to a position directly over the tub, and then

gently lowered into the water. Underwater massage and active and passive exercises, as well as resistance exercises, are then readily administered according to the needs of the individual case. Aside from the facilitation of motion due to the warmth and buoyancy of the water, nervousness is allayed and patients frequently drop off after the bath into a sound sleep. The need for narcotics is diminished and the patient is spurred on to increased effort by the realization that definite and rapid progress is being made.

Caution must be exercised to avoid fatigue both general and local. There is perhaps a natural tendency to err in this respect, because it is more or less of a chore to get a patient into the pool or tub and, when the patient is once in the water, both patient and instructor are apt to overstep safe limits. No general rules can be laid down. Careful observation of the patient while in the tub as well as the first few hours following will be necessary to detect evidence of fatigue.

In infantile cases, muscles will often be found to show signs of fatigue after four or five efforts, therefore, frequent rest periods are indicated. In cases of injury it will rarely be advisable to keep the patient in the tub more than twenty or thirty minutes. Special care should be exercised also to prevent chilling. Warm blankets and towels should be in readiness after removal from the tub to avoid this danger. It is felt that both sling suspension and underwater exercises are of particular value, because they permit early active function. This ranks first along physical therapeutic measures because it calls for function of the neuromuscular unit as a whole. This unit is composed of the motor cell in the brain cortex sending its axon down the pyramidal tract to make contact with the lower motor neuron in the spinal cord. The axon of the latter in turn makes contact with the contracting muscle cell. In addition the inhibitory mechanism is called into play, so that finely graduated precise movements are possible. Again every voluntary muscle contraction is accom-

Fig. 8—Sling under the knee suspended from a pulley attached to an overhead bar and controlled by the patient. The roller attached to the heel may be rotated through 90 degrees. A large piece of beaver board may be placed on the bed to provide a smooth surface.

panied by a corresponding relaxation of antagonistic muscles. The voluntary effort automatically calls into play every portion of this complicated mechanism, which cannot be claimed for other agencies.

While the beneficial effects of such simple exercises for normal as well as injured parts are readily appreciable to the patient, as well as to the physician and attendants and presumably attributable to improvement of circulation it is desirable to have some scientific explanation for this improvement. Moving pictures of

the circulation in the rabbit's ear and the effect of a rise of surrounding temperature on the circulation prepared by Drs Eliot R. Clark and E. A. Swenson of the anatomy department of the University of Pennsylvania are of interest in this connection. These show that while at ordinary temperature the circulation through the capillaries is slow one may say sluggish, a moderate rise in temperature is accompanied by a very marked increase in the rate of flow. That exercise exerts a similar influence is indicated graphically in the charts prepared at the Mayo Clinic, based on the work of Goldschmidt and Light. These show that the number of open capillaries in a given area of skin surface is more than doubled by exercise and that heat also increases their number while cold decreases their number in marked degree. In this connection, too, the work of Wright and Marquardt is of interest. They studied the capillaries in the nail bed of the finger and found that while in a normal active individual the

dental to invalidism. There is little danger, except in infantile paralysis, of the patient overtaking his strength during recumbency, because he can interrupt the exercises on the slightest signs of fatigue and resume them after suitable rest periods.

It must be emphasized that every case, of whatever type, must be studied carefully and a physical therapeutic program mapped out to meet the individual requirements, and also that the simple measures outlined here are merely aids in the rehabilitation program.

425 East Wisconsin Avenue

Council on Pharmacy and Chemistry

REPORTS OF THE COUNCIL

THE COUNCIL HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORT. THE COUNCIL'S CONSIDERATION OF BAYER ASPIRIN WAS BEGUN PREVIOUS TO THE HEARINGS OF THE FEDERAL TRADE COMMISSION IN THIS MATTER AND COMPLETED WITHOUT KNOWLEDGE OF THE CONTENT OF THE COMMISSION'S PUBLISHED DECISION. THIS REPORT REPRESENTS THE COUNCIL'S INDEPENDENT ACTION AND WAS NOT INFLUENCED BY THE GOVERNMENT'S ACTION.

PAUL NICHOLAS LEECH, Secretary

THE PRESENT STATUS OF ASPIRIN-BAYER

Aspirin-Bayer was omitted from New and Nonofficial Remedies in 1917 because of objectionable lay advertising of the product. The attention of the Council on Pharmacy and Chemistry was again called recently to the present character of the lay advertising promulgated by the manufacturers of Bayer Aspirin. An inquiry was received from the National Better Business Bureau, Inc., asking information as to the validity of the claims for curative value in colds made in this advertising. In the interest of the public, the Council therefore made a new survey of the advertising for Bayer Aspirin and found it more flagrant and insidious than that for which the product was long ago omitted from New and Nonofficial Remedies.

During the past decade, but more particularly within the past five years, Bayer Aspirin has been the subject of extensive lay promotion by advertising in newspapers in periodicals and by radio. A wide variety of therapeutic claims has been made ranging from mere statements of alleged superior solubility to outright and unqualified claims for actual prophylaxis and cure of the common cold. A number of claims, intermediary to these two extremes, relating to the relief of aches and pains of indiscriminate anatomic distribution also occur. Likewise may be found many statements pertaining to the alleged endorsement by the medical profession of Bayer Aspirin in preference to other brands to absolute safety in the use of the product irrespective of dosage, to its harmlessness on the heart (with the implication that such harmlessness is characteristic only of the Bayer preparation), and to its alleged greater rapidity of action. Probably no better idea concerning the general nature of the advertising can be conveyed than by the presentation of a number of selected and oft repeated quotations which have appeared in one or another newspaper or periodical from 1929 until the present.

See These Pictures If You Take Aspirin. They Show Why Genuine BAYER ASPIRIN is Rated the Fastest Safe Relief From Pain the fastest safe relief it is said ever known for pain —Chicago Tribune Oct 13 1933

It's safe in anybody's hands it has no ill effects. It always helps it never harms —Chicago Herald and Examiner Feb 10 1929

Buy the genuine Bayer Aspirin is made carefully. It has the endorsement of the medical profession —New York Sunday News (date not stated)

They don't depress the heart and may be taken freely. That is medical opinion. It is a fact established by the last twenty years of medical practice —New York Sun Oct 15 1931

Take some Bayer Aspirin. Take enough to bring complete relief. Genuine aspirin can't hurt anybody. They aren't just for head aches or colds! Read the proven directions covering a dozen other uses: neuritis, sciatica, lumbago, muscular pains —New York World Telegram Oct 15 1931

Fig 9—A plan of tub with dimensions. From Blount A. P. J. Bone & Joint Surg. 10: 506-508 (July) 1928

capillaries were rather closely packed in hairpin-like loops, those of the crippled arthritic hand were much less numerous and narrower, indicating that the little used, crippled hand was receiving a minimum of blood.

One is too apt to think of physical therapy in connection with injuries when, as a matter of fact, there is a large field for this branch of therapy in internal medicine, neurology and general surgery as well as in the specialties. I recall visiting the clinic of Professor Bardenheuer in Cologne in 1912. He had all his fracture cases in one large ward and made it a rule that when he entered the ward the patients immediately started carrying out certain exercises, not for the fractured limbs which may have been encumbered by splints or plaster casts, but for the uninjured limbs for the purpose of keeping up their general muscle tone and nutrition as well as the function of the heart and lungs.

One is also still too apt to forget that the body as a whole suffers with the injury of the part and that attention to these self-evident facts will do much to shorten convalescence and reduce the economic burden inci-

"Any doctor will tell you they are harmless. They don't hurt the heart. They don't upset the stomach. So take them as often as you have the least need of their quick comfort."—*Collier's magazine*, Feb. 27, 1932

"Bayer Aspirin does not depress the heart."—*Chicago Tribune*, April 28, 1931

"Take two or three tablets when you've caught a cold, and that's usually the end of it. From a grumbling tooth to those rheumatic pains which seem almost to bend the bones, Bayer Aspirin is ready with its quick relief. Any nagging, needless pain."—*Chicago Tribune*, May 5, 1932

"Take Bayer Aspirin at the first sign of a cold and you can ward it off."—(Reference unknown but clipping on file)

"You can head off a headache by taking these tablets, or nip a cold in the bud. But read the proven directions, and be ready to end more serious suffering."—*Los Angeles Times*, Nov. 8, 1931

If you have a cold—don't take chances with cold killers and nostrums. A cold is too dangerous to take chances on. The simple method pictured above [reference to picture of a man taking one or two Bayer Aspirin tablets with a full glass of water] is the way doctors throughout the world now treat colds. It is recognized as the QUICKEST, safest, surest way. For it will check an ordinary cold almost as fast as you caught it. That is because the real BAYER Aspirin embodies certain medical qualities that strike at the base of a cold almost INSTANTLY.

If throat is sore, gargle with 3 BAYER Aspirin Tablets crushed and dissolved in a half glass of warm water, repeating every 2 or 3 hours as necessary. Sore throat cases this way in a few minutes incredible as this may seem. Ask your doctor about this. —*Chicago Tribune*, Nov. 11, 1932

Bayer Aspirin has been actively promoted from coast to coast in a variety of publications as an utterly harmless sedative for symptomatic mitigation in a variety of conditions, and as a specific remedy for the prevention, abortion or cure of the common cold. Many other questionable statements might have been cited, but a critical discussion of those just quoted should suffice to illustrate their general unreliability. It should first be pointed out that Bayer Aspirin is merely a commercial proprietary name for the U. S. P. acetylsalicylic acid (from which it differs solely by its extensive advertising to the laity). For this reason it is classified in the general group of coal-tar antipyretics, which group, by reason of the similar therapeutic properties of its constituents, is useful in alleviating certain of the symptoms attendant upon the common cold. It has been contended that a threatening cold may be "aborted" by compounds of this group before it has become fully established, but to prove this it would be necessary to compare adequate series of threatening colds, one given the drug and the other not. No report of such a study can be found. Though the fever, headache and malaise may be minimized, there is no reason to believe that the usual course or duration of the common cold is in any way altered by the administration of acetylsalicylic acid of any manufacture. Physicians use these coal-tar antipyretics for the alleviation of symptoms of colds, not in any sense as a cure. Few, if any, competent physicians would subscribe to the claim, express or implied, that Bayer Aspirin, or any chemically identical or similar substance, is a specific remedy for colds and sore throats, or that it will cure such disorders.

The following claims are more explicitly considered.

Concerning greater solubility. Though it may be true that tablets of Bayer Aspirin disintegrate more quickly in a tumbler of water than do some other brands, there still is no evidence to show it any more rapid in the production of its effect in the patient. Regardless of the consistency of the original preparation, the drug must pass into the intestine before absorption in therapeutic quantity can take place, and the time ordinarily required for passage from stomach to intestine would probably be ample to allow of the disintegration of practically any preparation of acetylsalicylic acid, so that rapid disintegration of a tablet on contact with water does not appear pharmacologically significant.

Concerning medical endorsement. Here the burden of proof properly devolves on the firm. In 1917 (at about the time the patent expired on Aspirin) when the firm decided to adopt frank "patent medicine" methods in promoting the product, the Council published its first adverse report omitting the product from New and Nonofficial Remedies. Since that time, THE JOURNAL has, on a number of occasions, commented adversely on the product.

Concerning use as a gargle. The claim that "sore throat" is eased in a few minutes by gargling with a solution of Bayer's Aspirin, three tablets in half a glass of warm water, has not

been proved by convincing evidence. Some observations indicate that the warm water is as effective as the Aspirin.

Claim of harmlessness. The claims thus far discussed, though unfounded, do not embody any serious direct menace to individual or public health such as is unquestionably involved in the statements concerning the absolute harmlessness of Bayer Aspirin. Acetylsalicylic acid may be and has been repeatedly shown to be potentially harmful, directly or indirectly, when taken indiscriminately. Indirectly, its use may mask symptoms which, instead of being those of an approaching cold, a simple headache or a mild lumbago, might represent the prodromal stages of an acute infectious disease, pneumonia, brain tumor, brain abscess, tuberculosis, cancer of the spine, or any number of serious diseases too numerous for specific citation. It is only too obvious that an inestimable amount of harm will be done by treating an early pneumonia with aspirin until too late, or maltreating scarlet fever until the delay has inaugurated a community epidemic. It is quite true that it would be impractical, even if it were desirable, that people should "run to the doctor," every time that they are a little out of sorts, or think that they are. It is the physician's function to instruct his patients as to what they individually may with reasonable safety undertake in the way of self treatment, adapting the advice to the common sense, intelligence, education and temperament of the individual. It is not safe, either for the individual or for the public, to rely on advertisements for this instruction.

There is also the possibility of direct harm to the individual from the drug itself. On this score a number of reports of serious reactions appear in the literature. Mann¹ reports a case of myocardial impairment secondary to aspirin poisoning. Kraus² as early as 1914 reported a series of cases exhibiting allergic manifestations (urticaria, acute edema, either local or general, erythema, and pruritus) following the ingestion of as little as from 5 to 10 grains of acetylsalicylic acid. Roch³ has reported the production of some gastric irritation. Block⁴ has shown the toxic effects in animals to be identical with those of other salicylates, while Hanzlik⁵ has demonstrated acetylsalicylic acid to be one and one-fifth times as toxic as sodium salicylate in man. Stuell⁶ recorded chronic poisoning with symptoms of conjunctival catarrh and urticaria following a daily dose of 20 grains over a period of six years. The most serious reported reactions in recent years were observed by Lamson and Thomas.⁷ They record four cases of severe sensitivity to aspirin contained in a patent asthma powder. One patient died in acute air hunger within half an hour following the self administration of but one half of the recommended dose. The three other cases exhibited a prompt induction, or marked aggravation of asthmatic symptoms, requiring epinephrine for relief. One of these patients was rendered unconscious by the reaction and required the constant attendance of her physician for several hours thereafter. These authors conclude that "an abnormal response to acetylsalicylic acid is probably more common than to any other drug." The paucity of reports in the literature would not appear to substantiate such a conclusion. It is certain, however, that there are many more such instances which do not find their way into print and that there is always the possibility of injury to the individual. The fact that abnormal response is uncommon provides no solace for the victim, who has been assured of the absolute harmlessness of aspirin of any brand.

Finally, it should be emphasized that practically all American brands of acetylsalicylic acid are of pharmacopeial standard, to which all legally sold products must conform. The claims that there exist radical differences between Bayer Aspirin and other brands of acetylsalicylic acid manufactured by reputable concerns are unsubstantiated. Actually, the only impurity likely to occur in any reputable brand is salicylic acid (in mere traces only), which is of identical action and of no practical significance whatever as a contaminant.

The Council has authorized the publication of this report and has confirmed its rejection of Bayer Aspirin for inclusion in New and Nonofficial Remedies because

1 The unrestrained advertising of the Bayer product has given it an unfair advantage over other brands the manufacturers of which have adhered to the code which the Council has established in the interest of public health

2. It is expected that this unfair advantage will be reduced in the degree that the misleading advertising of Bayer Aspirin is restricted

3 The indiscriminate use of Bayer Aspirin, as urged in the advertising, is inimical to public and individual health, both directly and indirectly

4 Aspirin (acetylsalicylic acid) is potentially a dangerous drug and its unqualified use as a home remedy should be undertaken, originally in any case, under the guidance of the family physician, whose knowledge of the personal characteristics of the individual patient can alone render such use safe and advisable

MENINGOCOCCUS ANTITOXIN

THE COUNCIL HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORT
PAUL NICHOLAS LEECH Secretary

A review of recent studies convinced the Council that meningococcus antitoxin shows a promise that makes it worthy of more extended clinical trial, the evidence, however, not being sufficient to warrant unlimited acceptance, the Council voted to accept the product submitted by Parke, Davis & Co for one year only, in the hope that this acceptance may result in a clearer evaluation of its usefulness. At the end of that period the Council will give the product further consideration. A general description of meningococcus antitoxin, with a description of the accepted brand, appears in the New and Nonofficial Remedies Department of this issue

NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION
PAUL NICHOLAS LEECH Secretary

MENINGOCOCCUS ANTITOXIN—An antitoxin prepared by the immunization of animals to polyvalent filtrates of six to eight day hormone broth cultures of the four Gordon groups of meningococcus, after the method of Ferry, Norton and Steele.

Actions and Uses—The published studies on the effect of the antitoxin in experimental meningococcal septicemia in guinea pigs and rabbits, in experimental meningomyelitis in monkeys and in clinical epidemic meningitis in man suggest (1) that the symptomatology of the disease is attributable at least in part to the effects of a toxin produced by the organism and (2) that the clinical manifestations of the disease, its commoner complications and its mortality rate may all be favorably affected by the timely and proper administration of the antitoxin. The antitoxin should be used only in specific infections with the meningococcus, and the usual precautions concerning the administration of horse serum should be observed.

Dosage—Dependent on the condition of the patient, the degree of toxemia and the occurrence of complications, from five to ten thousand units of antitoxin may be administered intraspinally, intracisternally or intravenously, at twelve to twenty four hour intervals. The usual case is said to require a total of from 50,000 to 100,000 units.

Parke, Davis & Co, Detroit

Meningococcus Antitoxin P. D. & Co.—An antitoxic serum prepared by immunizing horses to bacteria free meningococcus toxin preserved with 0.1 per cent of tricresol. The antitoxin is standardized by human skin tests, the skin test dose of meningococcus toxin being that which when injected intradermally into a susceptible individual will produce a local skin reaction at least 10 mm in diameter. The unit of meningococcus antitoxin is ten times that amount of the antitoxin which when mixed with one skin test dose of meningococcus toxin will produce a negative reaction or a reaction appreciably less than 10 mm in diameter provided the controlled toxin reaction is appreciably more than 10 mm in diameter. The final product is standardized to contain not less than 350 units of meningococcus antitoxin per cubic centimeter. It is marketed in packages of one vial having a diaphragm stopper at each end and containing 10 thousand units of antitoxin.

ARROW BRAND SWEETENED CONDENSED MILK
LION BRAND PURE SWEETENED CONDENSED MILK

NESTLE'S BRAND SWEETENED CONDENSED MILK

SILVER BRAND SWEETENED CONDENSED MILK

Manufacturer—Nestle's Milk Products, Inc., New York and San Francisco

Description—Sweetened condensed milk prepared from milk and sucrose

Manufacture—Fresh milk from dairies under the company's supervision is strained, cooled and delivered to the condenseries in clean cans and tested for cleanliness, freshness and flavor. The milk is standardized as to fat and solids content, heated to 85 C and sucrose is added. The mixture is held at 85-90 C for five minutes, is concentrated in a vacuum pan at 55 C to somewhat less than one third of its original volume to conform to the United States Department of Agriculture standard for sweetened condensed milk, cooled to 18 C, and sealed in cans.

Analysis (submitted by manufacturer) —

	per cent
Moisture	26.0 27.0
Total solids	73.0 74.0
Ash	1.7 1.8
Milk fat	8.0 8.1
Protein (N X 6.38)	7.6 8.2
Sucrose	44.0 45.0
Lactose	11.0 11.9
Carbohydrates (by difference)	56.7 54.9

Calories—3.3 per gram 94 per ounce

Claims of Manufacturer—Conforms to U S Department of Agriculture definition and standard for sweetened condensed milk.

WARRANTY SIEVED PEACHES

Manufacturer—The Nielsen Corporation, Ltd., Oakland, Calif.

Description—Sieved peaches prepared by efficient methods for retention in high degree of the natural mineral and vitamin values. No added sugar or salt.

Manufacture—Fresh peaches are pitted by hand, passed through a lye peeling machine to remove skins, thoroughly washed to remove any adhering lye, and sorted to separate fully ripe from slightly underripe fruit. The former is either sieved immediately, as in the case of Warranty Sieved Spinach (THE JOURNAL, Feb 2, 1935, p 399), or canned and used later as needed for sieving.

Analysis (submitted by manufacturer) —

	per cent
Moisture	87.4
Total solids	12.6
Ash	0.6
Sodium chloride	trace
Fat (ether extract)	0.2
Protein (N X 6.25)	0.5
Reducing sugars as invert sugar	3.4
Sucrose	4.7
Crude fiber	0.6
Carbohydrates other than crude fiber (by difference)	10.0
Titratable acidity as malic acid	0.7

Calories—0.4 per gram 11 per ounce

Vitamins—The method of preparation and processing insures the retention in high degree of the natural vitamin values.

Claims of Manufacturer—Specially intended for infants, children and convalescents, and for special smooth diets. Only warming is required for serving.

SATURDAY, MARCH 23, 1935

VARIATIONS IN BEHAVIOR OF VITAMIN D

In 1919 Huldschinsky announced his observations on the efficacy of artificial ultraviolet irradiation in rickets. Four years later, Goldblatt and Soames demonstrated that irradiation of rats resulted in the development of antirachitic potency in the livers of these animals. The next year both Hess and Steenbock showed that when many food materials are exposed to these short wavelengths they exhibit antirachitic potency. In the course of the search for an explanation of the antirachitic activation, it has been demonstrated that the potency always follows the nonsaponifiable fraction of the lipids that the activated material is rather resistant to ordinary laboratory manipulation, and that over-irradiation results in the destruction of the effective compound. Naturally attempts were made to activate crystalline cholesterol, it is rendered highly potent by exposure to ultraviolet rays and retains this potency after a great many recrystallizations. Because activated cholesterol lost its potency when subjected to bromination and subsequent regeneration, it was concluded that a contaminant of cholesterol was responsible for the response to ultraviolet rays. Through studies based on fractional crystallization and on the absorption spectrums, ergosterol was identified as an accompaniment of cholesterol and was shown to be subject to intense activation by ultraviolet rays.

Once the fact was established that ergosterol is a precursor of vitamin D, there were reported many experimental studies which demonstrated the enormous potency of irradiated ergosterol solutions when compared to other recognized antirachitic substances such as cod liver oil and egg yolk. These comparisons were based on the official biologic assay in which the healing of the epiphysis of the femurs of rachitic rats is taken as the criterion of efficacy. After a time it was observed that, in tests of the toxicity of irradiated ergosterol, chickens were extremely resistant to overdoses of this material. When a comparison of viosterol (irradiated ergosterol) dissolved in oil with cod liver

oil was made on the basis of the prevention of leg weakness in chickens, the latter was enormously more effective. Addition of vitamin A to viosterol failed to increase its efficacy in preventing leg weakness in chicks. The same superiority of cod liver oil over viosterol and irradiated yeast was demonstrated when the proportion of ash in the leg bones of chickens was the criterion. Russell, Taylor and Wilcox¹ have recently shown that a higher percentage of bone ash and superior egg production were secured with cod liver oil than with many times the number of "rat units" of vitamin D given in viosterol but that superior storage of this vitamin resulted in liver and egg yolk when viosterol was employed. Again, rats were used in assaying the organs. A still more striking instance of discrepancy between these two widely used sources of the antirachitic factor has been cited by Bills, Massengale and Imboden.² They compared cod liver oil with about 100 units per gram with blue fin tuna liver oil with 40 000 units per gram (both oils assayed with rats) on the basis of the behavior in chicks, the blue fin tuna oil was only a sixth as effective as was the cod liver oil.

Similar comparisons between the various sources of vitamin D have been made in cases of human rickets. The question has become particularly pertinent with respect to milk that has been enriched in the antirachitic factor by various methods. Earlier studies indicated a discrepancy in the results with infants between cod liver oil and viosterol when the two were fed in amounts containing the same number of "rat units," the former, as with chickens, being more effective. More recent investigations of activated milks indicate that milk irradiated directly is superior to cod liver oil when fed in amounts providing the same number of "rat units." One suggestion for the enhanced antirachitic value of irradiated milk attributes peculiar efficacy to the protein-sterol combination that has been demonstrated in milk.³

There is accumulating a mass of experimental evidence which, when correlated, will inevitably result in a change in current views regarding the interrelationships between the various dietary factors providing what is now called vitamin D. It is evident that man, the chick and the rat each exhibits what appears to be a specific quantitative response (but which really may be a qualitative one) to various sources of vitamin D. It has been suggested that the antirachitic factors from different sources are not identical.⁴ Furthermore, the view that ergosterol is the provitamin D of cholesterol has been challenged recently by Waddell,⁵ who has presented evidence indicating that, when irradiated, cholesterol itself, apart

from the contaminating ergosterol, is rendered active in curing rickets. As inevitably happens, examination in closer detail of a collection of apparently well integrated circumstances has brought out some disturbing contradictions. However, this is part of the greater sweep of progress.

ASPIRIN-BAYER

Elsewhere in this issue (p. 1005) the Council on Pharmacy and Chemistry publishes a report on "The Present Status of Aspirin-Bayer." The methods employed by the exploiters of this brand of acetylsalicylic acid make desirable a recapitulation of the history of this product.

The original home of Aspirin-Bayer was Germany. Neither that country nor any others of importance would grant a patent either on the product acetylsalicylic acid or on the process of making it. The United States patent office granted both. As a result, for seventeen years—the life of a patent—it was impossible for any one in our country to manufacture or sell acetylsalicylic acid except the Bayer Company. Neither was it legal to import the substance. The monopoly thus granted the Bayer concern under the patent made it possible for the company to exploit the American medical profession and the public by charging an exorbitant price for aspirin.

More than twenty years ago THE JOURNAL collected data from American consuls abroad regarding the price at which acetylsalicylic acid was sold in foreign countries. At the time American druggists were paying 43 cents an ounce for aspirin. The American public was, of course, paying still more for it. During the same period acetylsalicylic acid was being sold to druggists in France, Germany, Holland, Denmark, Sweden and other countries in continental Europe for 4 cents an ounce, and in Great Britain for 6 cents an ounce. The American had to pay nearly eleven times as much for his acetylsalicylic acid as did the citizens of most other civilized countries.

In February 1917 the patents on aspirin expired. Then the company that had reaped the benefit of its monopoly attempted to continue the monopoly by claiming it had the exclusive right to the use of the trademark "Aspirin" under which the public had purchased the Bayer brand of acetylsalicylic acid. Fortunately the courts would not sustain this claim. Any pharmaceutical house may now manufacture acetylsalicylic acid and sell it under the name aspirin.

There followed a period during which the Bayer concern carried on an advertising campaign which led the public to believe that the only "genuine aspirin" on the American market was the Bayer product. The same campaign also stressed the alleged harmlessness of Aspirin-Bayer. As the company, like most of those employed in the "patent medicine" business, was shrewd enough to take advantage of the weakness of the pres-

ent national Food and Drugs Act, which cannot control claims made elsewhere than on or in the trade package it was not possible to reach the concern through the Food and Drug Administration. In June of last year, however, the Federal Trade Commission served a complaint against Bayer Co., Inc., of New York City, charging misrepresentation in the sale of aspirin tablets. The company was given until July 13, 1934, to file its answer, showing cause why the commission should not issue an order requiring it to cease and desist from the practices complained of.

The company, through its counsel, filed an answer asking that a hearing on the charges be waived and consenting to the commission serving an order to cease and desist. The commission thereupon ordered the company to cease and desist from representing in newspaper and magazine advertising or over the radio that aspirin is the trademark of the Bayer brand of acetylsalicylic acid and from making such claims as

"It does not depress the heart"

"It cannot harm the heart"

"Bayer aspirin is always safe"

"Perfectly harmless"

"You could take it every day without harm"

and many other similarly false and misleading claims. It was also ordered to cease claiming or representing that aspirin not made by the Bayer company is spurious or counterfeit.

This order was issued in September 1934. In the interim between the serving of the complaint and the issuing of the cease and desist order the Bayer Company brought down the retail price of its aspirin tablets to a price more nearly comparable with competing brands. It thus appears that exorbitant prices were first and foremost based on the monopoly granted through the patent law and, secondly, that an artificial price level was maintained by means of misleading claims to superiority together with the unjustified charges against its competitors.

IS THERE A "MORAL CENTER" IN THE BRAIN?

The cerebral localization of some peripheral actions is well established. The localization of others is merely a matter of speculation and debate, thus the status of sleep and heat regulation is still uncertain. When applied to more complicated phenomena such as the so-called moral sense, evidence for or against a "center" is even more difficult to assess.

Yawger¹ has recently discussed the possibility of a "moral center" in the brain based on the dissociation of social morality and certain intellectual or artistic qualities. Among the 'idiot savants,' he says, was 'Blind Tom,' a Negro musician of great talent. He was born a slave, and when he was 7 years old the family of his master, hearing strange music, found him

¹ Yawger, N. S. Is There a Moral Center in the Brain? *Am J Sci* 189: 265 (Feb.) 1935.

at the piano. He could at once reproduce the tunes he heard and repeat them after long intervals. Some of his music was from the classics and, if it had been played nervously when first heard, that too was included in the rendering. He could play a different tune with each hand at the same time, yet he was so foolish he would rise and, with his audience, applaud his own accomplishments. His intelligence was about that of a child of 4 years. There is room here for a reasonable doubt as to what quality might be localized.

Yawger refers also to Jesse Pomeroy, whose criminal career began at 13 with crimes of an especially brutal character. Pomeroy spent about forty years in solitary confinement, yet he read extensively, studied law and acquired some knowledge of several languages. Wainwright, another noted criminal, had an artistic temperament and was a poet, art critic, antiquarian and prose writer as well as a gifted forger and as subtle and secret a poisoner as has been known in almost any age. His known murders were numerous, but there were probably many that never received judicial notice.

Gilles de Rais, the original of Bluebeard, serves as another illustration of the combination of exceptional intellectual with exceptional criminal attainments. He could speak three languages and manifested great interest in military matters. His crimes were atrocious—apparently mostly of a sadistic type—and it was proved that he kidnapped or enticed to his castle at least 140 children.

Through disease, injury and shock, the mind may be strangely affected. There are many instances on record of persons whose intellectual characters have been markedly altered by such traumatism.

This evidence as to a "moral center" in the brain is unconvincing. If "morality" is a purely human trait, however, there can be no other source of evidence than by observation of human behavior. Moral sense is more closely allied to emotion than to intellect. The frequent dissociation of emotion and intellect may be nothing more than the alternating control of action by the lower and higher nervous centers.

Current Comment

TRACK ATHLETICS AND MUSCLE PHYSIOLOGY

Records in track athletics have gradually improved, notwithstanding the fact that men predicted twenty years ago that the height of ability had been reached. The human mind is ingenious. Improvements in style of running and in training have permitted records to be lowered again and again. Previous to 1888 it was customary for runners to start standing up. In that year a Yale athlete, C. H. Cherrill, first used the crouching start. He won his race and since that time almost all sprinters have used the crouch in their start. It is said that the starting blocks were invented by Bresnahan, the track coach of Iowa. These were origi-

nally designed to keep athletes from digging holes in the track for their feet. A study of their value, however, indicates that they permit a faster start because of their firmness, the average advantage being about one foot. Coaches are still working for ways of permitting athletes to start faster. According to Thomas K. Cureton they are now working on some system of ropes or grip handles that will permit the runner to stand in the running position, or really to get a running start while standing still. Some studies made by Japanese and recently confirmed by American investigators show that the amount of time runners are held in position while crouching ready to start is important. The fastest start is secured when they are held in this position one and a half seconds. The Iowa coach showed that left-handed athletes should start with the right foot, and right-handed athletes with their left foot forward. The best sprinters take a long breath and hold it just after the command "Get set." Holding the breath allows them to focus their attention better and perhaps aids the drive from the legs through fixing the abdominal muscles. The extensive studies that have been made indicate how science is able to help the runner in improving his speed. It is important for runners not to start cold. A famous record holder found that he started fastest in the sixth to the ninth start when twenty starts were made in a row. The investigations of physiologists show that the muscles change in their constitution during exercise and that the internal thickness of the muscle may be relieved by rubbing the legs, by the application of heat or by repeated starting before the final start is made.

A CANCER FUND FOR CANADA

To commemorate the twenty-fifth anniversary of the accession of King George V to the throne, the governor general of Canada is inaugurating the raising of "the King George the Fifth Silver Jubilee Cancer Fund for Canada." When completed, the fund will be administered by a board of trustees set up for the purpose. The Canadian Medical Association has authorized the establishment of a department of cancer control, and it is hoped that the fund will provide the necessary financial aid to enable it to carry out its program. A study committee has been developed within the Canadian Medical Association under the leadership of Dr. Alexander Primrose to work out the plan of attack. The plans include the securing of funds, the propagation of knowledge concerning cancer and the methods of attacking it, the establishment of a library of cancer, and the making of grants to aid cancer study and research. In outlining the plan of attack, the following points are given special consideration: (a) The attack against the cancer cell and the chemical reactions that occur within it. (b) Cancer-producing substances—petroleum in various forms, the hormone estrin, and so on. (c) Facts regarding anticancer serum. (d) Hereditary factors in cancer. (e) Chemical substances that destroy the cancer cell without being harmful to the normal cell, e. g., lead salts. (f) Cobra venom. (g) Biochemical investigation, in particular the metabolism of carbohydrates as sources of energy. The bio-

chemical results of radiation on the living cells (h) Immunity (i) Grading of malignant tumors (j) The cancer-producing properties of commercial lubricating oils (k) The serum test for cancer (l) Radium proper dose and legitimate field for employment The bomb X-rays This type of intensive effort should lead to considerable advancement in cancer control in Canada It is believed that both the public and the medical profession will aid in the development of funds and in the promulgation of the work The place of cancer on the list of causes of death emphasizes the necessity for more intensive activity than has thus far been developed in relationship to its control

COLLECTION AGENCIES

At various times in THE JOURNAL, physicians have been warned repeatedly to use extreme care in the selection of collection agencies and methods It has frequently happened that the physician is duped by naive salesmen, whose promises cannot be substantiated, into signing an apparently innocent paper, which later is found to be a contract Many of these contracts are in the nature of assignments which relieve the physician of all control and ownership of the accounts

During a recent broadcast, a representative of the Better Business Bureau of Chicago presented some of the Better Business Bureaus ideas and experiences with collection agencies and methods The principal parts of this broadcast talk are given below

"It has been said on good authority that a creditor is his own best collector, and, in the case of debts owing to doctors, dentists and other professional men, this is undoubtedly true However, whether you are a professional man or a merchant, it would be indeed unusual if you could personally find time to collect all your outstanding debts The task would be almost impossible

"The alternate followed by most business men today is to turn over to a professional collection agency the job of collecting his past due accounts Ordinarily, this service is rendered for a fee, sometimes a flat rate, but usually on a commission or contingency basis

"About three years ago Chicago was overrun by a small group of crooked collection agencies, which took many thousands of dollars from the community before their activities were terminated by the State's Attorney's office They were openly operating against the law but were enabled to collect these large sums of money through a clever trick, which might be characterized as 'collecting from the creditor'

"The procedure was usually about as follows You would be approached by a salesman of one of these companies, who would tell you in glowing exaggerations what unusual success his company had experienced in collecting money You need not pay the company anything until the collections had been remitted to you and there was no necessity for you to sign any contract or other written agreement No doubt this type of presentation would appeal to almost any business man, most of whom had large numbers of outstanding accounts three years ago

You can see no objections to turning over to this man some of your accounts as a trial—and, of course you picked out your oldest accounts and usually the ones which you had long since given up hope of ever collecting Perhaps you smiled inwardly as you gave these accounts to the salesman, but the salesman was also smiling inwardly because he received a liberal commission for obtaining every one of your accounts These salesmen's commissions were, in fact, so liberal that the offices of these gyp concerns were besieged every morning by men and women anxious to work for these companies Little did they know of the reputation and methods of doing business of these fly-by nights—all they knew was that their friends were making substantial commissions and why shouldn't they?

On the day following the visit of the salesman you receive a neatly typewritten letter from the company acknowledging

receipt of your accounts and assuring you that they would receive prompt attention The 'prompt attention' was usually forthcoming about three weeks or a month later in the form of a telephone call from the company's office It went something like this 'Mr Jones, we have just located a substantial bank account in the name of one of your debtors, and we would like to "tie it up" immediately to prevent his withdrawing any funds until your debt is paid If you will advance \$17.50 for legal expense we will proceed immediately to collect your debt of \$450 I will send our messenger to your office within the next few minutes to pick up your check, as no time should be lost'

'While somewhat bewildered, you are so astonished to learn that this particular party from whom you had been trying to collect your debt for the past several years was clever enough to conceal a bank account outside the city that you give little thought to the possibility of the entire matter being a trick to obtain your money Neither is there much opportunity given you to reflect, because the company's messenger is in your office within a few minutes after you have hung up the receiver You reason that if you can collect \$450 by sending \$17.50, that certainly is good business, so the messenger receives your check This same procedure may be repeated once or twice more before you come to the conclusion that the company is not acting in good faith Usually, however, the average business man will hesitate before giving the company another check until he sees the results from the first one

"Nothing further is heard from the company and your telephone calls are greeted by the various evasions popularly known as buck-passing 'Mr So-and-So is out of the office and will call you back' or 'he is no longer with the company because we found he was crooked' Personal calls at the office of the company result in nothing because you can never find any one in authority—he is always 'out'

"When the State's Attorney's officers raided one of these fly-by-night concerns, the records of the company showed more than \$1,000 a day was being collected by this means The only substantial expense of the company was commissions paid to solicitors, for no trace of any actual collection efforts in the form of letters, garnishments, wage assignments or other legal procedure was found when the company's records were examined The only money collected was taken from the creditors—not the debtors

'Needless to say, there are no such companies operating in Chicago at the present time However, there are a large number of collection agencies which are today operating on what is known as a 'shoe string' These companies are operated by individuals who might make some effort to collect your debts When they are successful, they usually retain most of what they collect for various fees, legal charges, and the like It is a rare occasion when you can obtain a statement from the agency showing the status of your accounts, and if such a statement is ever forthcoming it will probably set forth collection charges far in excess of actual collections, so that you owe the company money

'Examination of your written agreement will disclose a confusing mass of 'ifs, and buts' Of course, you never read the agreement before you signed it, so that you have nobody to blame but yourself If you take the trouble to dissect the various conditions in your contract, you will undoubtedly discover that the company has protected itself in every possible legal way and the various charges levied are all within the company's rights Obviously, such collection service is of no value to you The high pressure methods used by such companies in collecting your debts will invariably destroy your customers' good will and render them valueless as a future source of business At the same time, you gain absolutely nothing and your debts must eventually be written off your books as a dead loss, even though the collection agency has collected in full

'If you must employ the services of a collector, be certain that he is reliable Regardless of whether he is a lawyer or a member of some association of collection agencies investigate his past record and ascertain whether he has any satisfied clients—not clients who have just recently employed his services, but those who have been dealing with him for several years Any reliable collection agency will gladly furnish you with such references"

ALABAMA

State Medical Meeting at Mobile—The sixty-eighth annual session of the Medical Association of the State of Alabama will be held in Mobile, April 16-18, with headquarters at the Battle House, under the presidency of Dr. William M. Cunningham, Jasper. The Mobile County Medical Society will be host to the society, and the following guest speakers will be included on the program:

Dr. Arthur Neal Owens, New Orleans, Skin Grafting Its Relation to General Surgery
Dr. Edward Nicholas DeWitt, Bridgeport Conn. The Detached Retina
Dr. Edgar Burns, New Orleans, Renal Calculi
Dr. William B. McGee, New Orleans, Treatment of Severe Pre-eclampsia and Eclampsia with Ephedrine

Dr. George Henry Semken, New York, will deliver the Jerome Cochran Lecture, Wednesday morning, his subject will be "A Consideration of Tumors of the Breast." On the same day, Dr. James S. McLeister, Birmingham, President-Elect, American Medical Association, will speak on "Trends of Medical Practice." At a public meeting, Wednesday evening, Dr. Austin A. Hayden, Secretary of the Board of Trustees, American Medical Association, Chicago, will show a motion picture demonstrating the activities of the Association. Other physicians on the program include the following:

Theron K. McFatter, Dothan, Safety of Low Cesarean Section in the Obstetric Emergency
Eugene Thames, Mobile, Chronic Undulant Fever
Colvin C. Perdue, Mobile, Foreign Bodies in the Food and Air Passages
William Hill McCaslan, Union Springs, The Nervous Child
Thompson F. Wickliffe, Jasper, Deep Surgical Infections of the Neck
Gordon C. Usary, Roanoke, Status of Hysterectomy in Rural Surgical Practice
Dan C. Donald, Birmingham, Acute (Hemorrhagic) Pancreatitis
William W. Harper, Selma, The Enlarged Thyroid
Claudius O. Lawrence, Clanton, Value of Local Applications in Distal Cases of the Respiratory Tract
Amos C. Gipson, Gad-den, Treatment of So Called Colitis in Infants and Children

H. Earle Conwell, Fairfield, Problems Frequently Encountered in Recent Fractures
Marion T. Davidson, Birmingham, Some Little Known Manifestations of Allergy
Crawford H. Cleveland, Anniston, Chronic Hoarseness
Gilbert F. Douglas, Birmingham, Ovulation, Menstruation, and Finding the "Safe Periods"
Cabot Lull, Birmingham, The Doctor and Life Insurance
John L. Branch, Montgomery, Infections of the Hand

The tenth annual meeting of the woman's auxiliary will be held at the Battle House, April 16-17. There will also be a symposium on pulmonary tuberculosis by Drs. Reuben Alec Brown, Montgomery, and James Otis Lisenby, Atmore.

ARIZONA

Bill Passed—H 88 has passed the house, proposing to create a board of naturopathic examiners and to regulate the practice of naturopathy. Naturopathy, which, the bill states, includes all forms of physiotherapy, is hereby defined to be a system of treating the abnormalities of the human mind and body by the use of drugless and nonsurgical methods, and includes the use of physical, electrical, hygienic, and sanitary measures incident thereto.

Bills Enacted—The following bills have become laws: S 15, repealing the laws regulating the distribution and possession of narcotic drugs and enacting what apparently is the uniform narcotic drug act, and H 19, enacting a new pharmacy practice act which seems to prohibit physicians from dispensing drugs and medicines but permits them to administer personally "drugs and medicines carried or kept for emergencies in order to supply the immediate needs of their own patients."

ARKANSAS

Bill Passed—H 218 has passed the house and senate, proposing to amend the medical practice act so as to authorize the boards of medical examiners, in their discretion, to license without examination diplomates of the National Board of Medical Examiners.

CALIFORNIA

Health Insurance—The house of delegates of the California Medical Association, at a special meeting in Los Angeles, March 3, voted its approval of health insurance. A committee was appointed to cooperate with a committee of the state senate now studying the problem in framing legislation to establish a health insurance system, mandatory as to certain population groups and voluntary as to certain groups. The resolution set forth the following principles to be followed in the framing of the measure: (1) The patient shall have absolutely free choice of physician and hospital, (2) the medical profession shall determine the scope, extent, standards, quality, compensation paid for and all other matters and things related to the medical and medical auxiliary services rendered under the system, (3) there shall be no provision for cash benefits, and (4) the patient shall receive adequate treatment and his physician shall receive adequate compensation.

COLORADO

Bill Introduced—S 277 proposes to make it unlawful for any person to receive hospital care with intent to defraud the hospital of the amount due it for such care. It is to be prima facie evidence of intent to defraud for a patient to leave a hospital without paying his bill.

DISTRICT OF COLUMBIA

Memorial Service for Dr. Theobald Smith—A memorial service was held at George Washington University School of Medicine, February 19, in honor of the late Dr. Theobald Smith, Princeton, N. J., director emeritus of the Department of Plant and Animal Pathology, Rockefeller Institute for Medical Research. Dr. Earl B. McKinley, dean of the medical school, reviewed the life and work of Dr. Smith. Following this service, the third lecture in the Smith-Reed-Russell series was presented by Dr. Thomas R. Boggs, associate professor of medicine, Johns Hopkins University School of Medicine, Baltimore. His subject was "Mycotic Infection of the Lung."

Medical Bills in Congress—H R 6685, introduced by Representative Quinn, Pennsylvania, proposes to provide for the examination and registration of those who desire to engage in the occupation of beauty culture, which is defined to include, among other things, "the removal of superfluous hair, and the massaging, cleansing, stimulating, manipulating, exercising, or similar work upon the scalp, face, arms, or hands, or the upper part of the body, by the use of mechanical or electrical apparatus or appliances or cosmetics, preparations, tonics, antiseptics."

tics, creams, or lotions

" H R 6735, introduced by Representative Norton, New Jersey, proposes to provide for the prevention of blindness in infants born in the District of Columbia

GEORGIA

Bill Enacted—S 60 has become a law, repealing the laws regulating the possession, sale or distribution of narcotic drugs and enacting what apparently is the uniform narcotic drug act

Fischer Prizes Awarded—Drs W Frank Wells and Stacy C Howell, Atlanta, were awarded the L C Fischer Prizes of the Fulton County Medical Society for 1934 at its annual banquet, January 3. Dr Wells received the prize for the most original paper, his subject was Modern Surgical Advances. Dr Howell's paper on "Epinephrine—A Drug for Treatment of Glaucoma" was considered the best written. The prizes are awarded annually

IDAHO

Personal—Dr Norando G Logan, American Falls has been appointed health officer for Power County.—Dr Harwood L Stowe, Kimberly, has been appointed coroner of Twin Falls County to succeed the late Dr Frank A Daight, Filer

ILLINOIS

Bill Introduced—S 238, to amend the medical practice act, proposes to create a board of chiropractic examiners

Heart Disease Leads in Mortality—Heart disease accounted for 21,034 deaths in the total of 87,195 in Illinois for 1934, according to the state health department. A general mortality rate of 111 per thousand was noted for the year, a figure slightly higher than the average since 1929 but substantially lower than that for any previous year on record. The report stated that although the birth rate, 14 per thousand of population, was slightly higher last year than in 1933, the rise in mortality offset the gain, leaving an excess of only 23,000 births over deaths, the lowest on record. The maternal mortality rate (48 per thousand births) was the lowest on record but the infant death rate of 53.2 per thousand births was noticeably higher than for 1933. A new low level was reached for mortality from tuberculosis, 4,102 deaths giving a rate of 52 per hundred thousand of population. There were sharp advances in mortality from infantile diarrhea and pneumonia. Second to heart disease was cancer, accounting for 9,638 deaths, nephritis, 8,156 accidents, 6,919 cerebral hemorrhage 5,600 pneumonia, 5,901, and tuberculosis 4,102. These seven causes accounted for substantially more than half of all mortality last year, and all but tuberculosis and cerebral hemorrhage were responsible for marked increases

Chicago

Dr Cort to Give Gehrmann Lectures—William W Cort Ph.D., professor of helminthology, Johns Hopkins University School of Hygiene and Public Health, Baltimore will deliver the Gehrmann Lectures of the University of Illinois College of Medicine, April 8-10. The titles of the three lectures are

Studies on Ascariasis in Children in the United States
Epidemiology and Control of Schistosomiasis (Bilharziasis) in Egypt
Present Status of the Hookworm Problem in the United States

Society News—Dr George W Crile, Cleveland discussed shock before the Englewood Branch of the Chicago Medical Society, March 5.—Speakers at the meeting of the North Side Branch of the Chicago Medical Society, March 7 were Drs Andrew C Ivy and Anton J Carlson on "Anterior Lobe of the Hypophysis—Function and Clinical Pathology" and Physiology of the Ovaries respectively.—Speakers before the Chicago Pathological Society, March 11, included Drs Frank M Cochems and Theophil P Grauer on 'Squamous Cell Carcinoma Leukoplakia and Concretions in a Megalo-Ureter'.—Dr Henry Kennon Dunham, Cincinnati among others addressed a joint meeting of the Chicago Roentgenological Society, Chicago Tuberculosis Society and the Chicago Tuberculosis Institute, March 14, on emphysema.—The Chicago Gynecological Society was addressed March 14 by Drs Edward H Richardson, Baltimore, on 'Abdominal Hysterectomy' and Noble Sproat Heaney on 'Vaginal Hysterectomy'.—The Chicago Ophthalmological Society was addressed, March 18 among others, by Dr Leo L Mayer and H W Magoun Ph.D. on Effects on the Pupillary Reaction of Lesions in the Posterior Commissure.—Dr Samuel L Gabby Elgin discussed "Dermatitis Probably Due to Dyes" before the Chicago Society of Allergy, March 18 and a review of recent literature on urticaria was presented by Drs Francis L Foran, Tell Nelson Samuel J Taub, Leon Unger, William L Beecher and Samuel M Feinberg

INDIANA

Bill Enacted—H 490 has become a law, providing that on the commitment of a person to an institution for the insane he or she be rendered sterile.

Course in Otolaryngology—The tenth annual two weeks course in otolaryngology of the Indiana University School of Medicine, Indianapolis, will be conducted April 15-27. The course will consist of complete and minute dissection of the head and neck with practical applications by Dr John T Barnhill, and twelve mornings of clinical instruction and surgery by Dr Barnhill and members of the staff in otolaryngology of the medical school. Further information may be obtained from Dr Willis D Gatch, dean of the medical school

Society News—Dr Walter A Foreman, Rockville, addressed the Owen County Medical Society in Spencer, February 21, on 'Early Diagnosis of Tuberculosis'.—At a meeting of the LaPorte County Medical Society in Michigan City, February 21, Dr Charles Marshall Davison, Chicago, discussed Recurrent Cholecystitis Following Cholecystectomy.—Dr Virgil H Moon, Philadelphia, discussed "The Shock Syndrome in Medicine and Surgery" before the Indianapolis Medical Society, March 19. A symposium on diseases of the thyroid gland will be given, March 26, speakers will be Drs Harold F Dunlap Cleon A Nafe and Harold C Thornton. A speakers' bureau is being organized for the society, its activities to be confined to Marion County

Correction—Reciprocity with New York—THE JOURNAL reported the establishment of reciprocity relations of Indiana with New York March 16, page 929. Inadvertently, this item was taken from a column in the Journal of the Indiana State Medical Association containing news of twenty-five years ago

IOWA

Bills Introduced—S 168, to amend the osteopathic practice act proposes (1) to eliminate the provision of the present law which specifically denies osteopathic physicians and osteopathic physicians and surgeons the right to prescribe or give internal curative medicines, (2) to permit osteopathic physicians to practice obstetrics and minor surgery, and (3) to define osteopathic practice as "that method of rehabilitating, restoring and maintaining body functions by and through manual stimulation or inhibition of nerve mechanism controlling such body functions, or by the correction of anatomical maladjustment, and/or by other therapeutic agents, methods and modalities used supplementary thereto, but such supplementary agents, methods or modalities shall be used only preliminary to, preparatory to and/or in conjunction with such manual treatment, and to declare that such osteopathic practice is not the practice of medicine within the meaning of the medical practice act. S 177 proposes to include marihuana within the scope of the laws relating to the sale, distribution or possession of narcotic drugs

KANSAS

New County Health Officers—The state department of health announces the following new appointments of county health officers

Dr Francis D Kennedy Norton, Norton County
Dr James H A Peck St. Francis Cheyenne County
Dr Frederick E Dargatz Kinsley Edwards County
Dr William F Schroeder Newton Harvey County
Dr Ernest J Beckner Goodland Sherman County
Dr Charles E Gaston Frankfort Marshall County

Personal—Dr Marjorie G Eberhart has resigned her position on the student health department staff at Kansas State Agricultural College, Manhattan, to become head of the physical education department at Central Normal College, Danville, Ind. She has been succeeded by Dr Osee May Dill.—Dr Joseph R Bethausen Hays, was elected president, recently, of the newly organized Ellis Doctors' Club which is composed of the thirteen physicians in Ellis County. Dr Harry R Bryan, Hays is secretary. The club, which holds monthly meetings, was created to cooperate with the county commissioners in the care of indigent sick

LOUISIANA

Bill Enacted—H 16-XXXX has been enacted as Act No 16, Acts, 1934, amending the penalty section of the uniform narcotic drug act, enacted recently by the second special session of the legislature, by making a violation of the act punishable by imprisonment at hard labor for not less than twenty months nor more than five years

Society News—Dr W Russell MacAusland, Boston, addressed the Orleans Parish Medical Society, January 21, on

"Mobilization of Ankylosed Joints by Arthroplasty" Speakers before the society, March 11, were Drs James D Rives and Laurence H Strug on "Treatment of Hirschsprung's Disease by Spinal Anesthesia", Emmerich von Haam and Louis Lichtenstem, "Incidence and Clinical Manifestations of Lymphogranuloma Inguinale in New Orleans," and Isidore Cohn, "Diagnosis and Treatment of Some Vascular Disturbances of the Extremities"

MARYLAND

Advisory Board for Department of Welfare—An advisory committee was recently appointed for the newly created municipal department of welfare of Baltimore Dr Wmford H Smith, medical director, Johns Hopkins Hospital, was named chairman of the committee, and Dr George Walker, vice chairman. Other members include Drs Esther L Richards and Harry S McCarr

Additional DeLamar Funds—The Johns Hopkins University School of Medicine, Baltimore, has received an additional gift of \$150,000 from the estate of Joseph Raphael DeLamar, who died in 1918. A fund of \$4,706,450, which has been paid to the medical school over a period of years under Mr DeLamar's will, supports many activities, including the DeLamar Lectures in Hygiene at the Johns Hopkins University School of Hygiene and Public Health. The will provided that, after other bequests had been made, the residue was to be divided so that one third went to the medical school and another third to Columbia University College of Physicians and Surgeons. This is the authorization for the recent gift. The DeLamar Lectures were established "to give to the people of the United States generally the benefits of increased knowledge concerning the prevention of sickness and disease and also concerning the conservation of health by proper food and diet"

MASSACHUSETTS

Dr Lord Becomes Professor Emeritus—Dr Frederick T Lord, since 1930 clinical professor of medicine, Harvard University Medical School, was retired from the faculty as professor emeritus, January 1. Dr Lord, who is 60 years of age, graduated from Harvard in 1897 and received his degree in medicine in 1900. He has been associated with the institution in a teaching capacity since 1905, when he was named assistant in clinical medicine. He was a member of the American Red Cross Commission to Serbia in 1917. He is president of the Massachusetts Tuberculosis League and a former president of the American Association for Thoracic Surgery.

Bills Introduced—H 1157 proposes to create a board of chiropractic examiners and to regulate the practice of chiropractic defined by the bill as "the science of spinal examination, the adjusting of the segments and articulations of the human spinal column by hand only." Chiropractors are to be prohibited from practicing obstetrics, from prescribing or administering drugs or medicines, and from performing surgical operations with the use of instruments. H 1894 proposes that a commission composed of two senators, five representatives and four citizens be established to investigate and study the subject of health insurance and to report its findings to the general court.

MICHIGAN

Graduate Conferences—The Wayne County Medical Society, Detroit Tuberculosis Sanatorium and Detroit Department of Health are sponsoring a series of graduate conferences in acute communicable diseases and tuberculosis at the Herman Kiefer Hospital, which began March 5. The conferences are presented by Dr Bert U Estabrook and associates in acute communicable disease and Dr Bruce H Douglas and associates in tuberculosis.

Personal—Dr Hubert M Heitsch has resigned as director of public health of the city of Pontiac to accept a position on the medical staff of the new combined Chevrolet and Fisher Body plant at Baltimore, newspapers report.—Dr Perry V Wagley has been named acting medical superintendent of Pontiac State Hospital, succeeding the late Dr Edmund A Christian, who retired the day before his death.—Dr Frederick McD Harkin has been appointed health officer of Marquette to succeed Dr Thurman R. Laughbaum, resigned. Dr Harkin held the position in 1893.—Dr Howard P Blake, Bergland, has been appointed full time physician at the Marquette branch prison. He succeeds Dr Foster A Fennig, resigned, who held the position on a part time basis.—Dr Frank P Bohn, Newberry, was honored at a celebration March 1, commemorating his completion of forty-five years in the practice of medicine.

MINNESOTA

Bill Introduced—H 1075, to amend the workmen's compensation act, proposes to add to the list of compensable occupational diseases "poisoning by carbon monoxide fumes or its sequelae"

Personal—Mr James H Baker has been employed as executive secretary of the Hennepin County Medical Society, Minneapolis. Mr Baker was formerly engaged in newspaper work.—Dr Carl Gustaf Arvidson, Minneapolis, has been knighted by King Gustav of Sweden. Later he will receive the Order of Vasa.—Dr Chauncey A McKinlay, Minneapolis, has been named assistant editor of *Minnesota Medicine*.

Extension Course in Refraction—The University of Minnesota School of Medicine will offer an extension course in refraction, April 1-28, designed especially for rural medical practitioners who wish to supplement their general practice by work in refraction and physiologic optics. The work will be under the supervision of the department of ophthalmology and has been arranged to furnish the elements of ophthalmology, the elementary physiology of vision, physiologic optics and testing and recording of vision. The mechanical problems of neutralization of lenses and different methods of determining refractive errors and muscle imbalance will be taken up. The theory of and practice in skiascopy and postcycloplegic refraction are also included.

MISSOURI

Bill Enacted—S 28 has become a law, prohibiting the cultivation, curing, preparation, distribution or possession of marijuana. It is not to be unlawful, however, for any licensed pharmacist to possess and to dispense the drug on the written prescription of a physician, osteopath, dentist or veterinarian.

Bills Introduced—S 148 proposes to authorize the sterilization of insane, idiot, imbecile, feebleminded or epileptic inmates of state institutions. H 300, to supplement the workmen's compensation act, proposes to make it a misdemeanor for any person having charge of any medical or hospital record of any injured workman to refuse to permit such record to be inspected or copied by the workmen's compensation commission, the employer, the workman or his dependents, or any other party to any proceedings for compensation under the act.

Clinical Meeting—The spring meeting of the Kansas City Southwest Clinical Society was held at the Hotel President, Kansas City, March 11. Guest speakers included Drs Frederic W Bancroft, New York, on "Clinical Deductions in the Handling of Fractures Obtained from the Study of Bone Repair", Alfred W Adson, Rochester, Minn., "Surgical Consideration of Essential Hypertension" (round table luncheon), Irvin Abell, Louisville, Ky., "Diagnosis and Treatment of Diverticulosis and Diverticulitis," and Charles L Scudder, Boston, "Treatment of Fractures of the Neck of the Femur".

Society News—Dr Oswald P J Falk discussed "Management of the Heart in Hypertensive Disease" before the St Louis County Medical Society, March 13.—Speakers before the St Louis Medical Society, March 12, were Drs Leonard T Furlow on "Chronic Subdural Hematoma", Park J White Jr., "Prevention of Respiratory Infections in Children," and Harry W Lyman, "Relation of Upper Respiratory Infections to the General Condition of the Patient in Infancy and Childhood".—A joint meeting of the Jackson and Wyandotte County medical societies was addressed, among others, February 12, by Dr Carroll M Pounders, Oklahoma City, on pediatric therapy.

NEBRASKA

Bill Enacted—H 147 has become a law, repealing the laws regulating the sale, possession or distribution of narcotic drugs and enacting what apparently is the uniform narcotic drug act.

NEW JERSEY

Enforcing the Medical Practice Act—The state board of medical examiners reports numerous prosecutions during the past few months. Among several irregular practitioners who pleaded guilty and paid the penalty were the following:

Jules F Blondan of the Modern Medical Associates, Jersey City
Oliver L Schreibweis Plainfield a nurse
Alfred W Reid unlicensed chiropractor
Irvin W Kirk whose license was revoked in 1933
Simon Noveck owner of a drug store but not a registered pharmacist
William Carl Hirsch of the Church of Inner Truth Secaucus
Anthony Zurawski of the Modern Medical Associates of Newark
Jerry Giffune of the Men's and Women's Medical Office Newark

Personal—Dr Henry H Kessler, Newark, delivered the Hunterian Lecture before the Hunterian Society of England, in London, January 14, on "The Contribution of John Hunter

to Rehabilitation of the Crippled and Disabled"—Dr Paul Keller has resigned as executive director of Newark Beth Israel Hospital, Newark, to engage in private practice.—Dr Louis Klein, Detroit, has been appointed to assume direction of all medical activities of the firm of Hoffman-La Roche, Nutley. Dr Klein has occupied a similar position with Parke, Davis & Co in Detroit, where he was on the medical staff of Harper Hospital and was also consulting endocrinologist to the Wayne County Juvenile Court.—Dr William M. Brien, Orange, has resigned as first assistant medical examiner of Essex County, to become health officer of Orange. His successor is Dr George P. Olcott Jr, East Orange.—Dr John F. Hagerty, Newark, was the guest of honor at a dinner at St. Michael's Hospital, January 30, marking his retirement as medical director after forty years' service with the institution.

NEW YORK

Internships at Letchworth Village—One year residencies for the study of mental deficiency are offered by Letchworth Village, Thellus, one of the New York state schools for mentally deficient persons, beginning July 1. Requirements include graduation from a class A medical school and a year's general internship. Applications should be sent to Dr Charles S. Little, superintendent, Letchworth Village, Thellus, N. Y.

Bills Passed.—The following bills have passed the assembly. A 195, proposing to amend the provisions of the vital statistics law which requires that the personal particulars called for in a certificate of birth shall be authenticated by the signature of the informant, who may be any competent person acquainted with the facts, by providing that such personal particulars shall be obtained from a competent person acquainted with the facts, and A 445, proposing to safeguard the distribution of "dangerous caustic or corrosive substances" as defined by the federal caustic poison act, by requiring their labeling as "poison." S 344 has passed the senate, proposing to amend that provision of the vital statistics law which requires that the personal particulars called for in a certificate of birth shall be authenticated by the signature of an informant, who may be any competent person acquainted with the facts by providing that such personal particulars shall be obtained from such a person.

Bills Introduced—S 1556, A 1935 and A 2197 propose to prohibit any state, county or city hospital or any hospital supported in whole or in part by public funds to employ nurses or other employees for more than eight hours in any one day. S 1593, to amend the medical practice act, proposes to make it unlawful for any one other than a licensed physician to conduct, direct, supervise or control the work or reports of a clinical laboratory, which is defined as a laboratory in which tests are made on individual persons their secretions, excretions, blood and tissues to aid in the diagnosis, prognosis, or treatment of the individual's physical or mental state or states. The provisions of the bill, however, are not to apply to the qualitative or quantitative analysis of urine by a licensed and registered pharmacist, or to a clinical laboratory director duly licensed to conduct direct or supervise a clinical laboratory within the city of New York, or to any person who has conducted directed or supervised a clinical laboratory in the state for a period of at least six months prior to the date this bill may become enacted.

New York City

Personal—Dr Paul Mazzuri, assistant medical director of the New York Life Insurance Company, retired February 28, having reached the age of 70. Dr Mazzuri has been on the insurance company's staff since 1903.

The Janeway Lectures—Dr Gleb V. Anrep, professor of physiology, Egyptian University, Cairo, Egypt will deliver the Edward Gamaliel Janeway Lectures at Mount Sinai Hospital, March 25 and 26. His subjects will be "The Duodenopyloric Mechanism in Relation to the Sympathetic Nervous System" and "The Coronary Blood Flow in Relation to Pulse Pressure."

Symposium on Scientific Education—The science forum of the New York Electrical Society will present a symposium entitled "Scientific Education—What Is Wrong With It?" at its regular meeting March 27. Speakers will be Harry Woodburn Chase, LL.D., chancellor of New York University; William E. Wickenden, Sc.D., president Case School of Applied Science, Cleveland; Colin G. Fink, Ph.D., head of the division of electrochemistry, Columbia University; and Dr Alan Gregg, director for the medical sciences Rockefeller Foundation.

NORTH CAROLINA

Bill Passed—H 293 has passed the house and senate, proposing to amend the workmen's compensation act by making some twenty-five occupational diseases compensable, included among them are anthrax, compressed air illness, chrome ulceration, silicosis, asbestosis, tenosynovitis, bursitis, miners' nystagmus and poisoning from arsenic, brass, zinc, manganese, lead, mercury, phosphorus, carbon bisulphide, methanol, naphthalogenated hydrocarbons, benzol, nitro amido derivatives of benzol, radium, carbon monoxide, sulphuric, hydrochloric and hydrofluoric acid.

Personal—Dr Bennie B. Dalton, Rockingham, has recently been appointed health officer of Richmond County.—Dr Wyman Plato Starling, Roseboro, has been appointed health officer of Simpson County, succeeding Dr Stephen Glenn Wilson, Clinton who resigned to engage in private practice at Angier.—Dr John W. Williams, Monroe, La., has been appointed health officer of Asheville to succeed the late Dr Dan E. Sevier.—Dr Aldert S. Root was recently elected president of the Raleigh Academy of Medicine.—Dr James B. Bullitt, professor of pathology, University of North Carolina School of Medicine, Chapel Hill, was elected president of the local chapter of the American Association of University Professors recently.—Dr Addison G. Brenizer, Charlotte, was recently elected commander of the Charlotte Post of the American Legion.

NORTH DAKOTA

Bills Enacted—The following bills have become laws. H 8, amending the chiropody practice act by defining a chiropodist as one who examines, diagnoses and treats abnormal nail conditions, excrescences occurring on the feet including corns, warts, callosities, bunions and arch disorders, or one who treats medically, mechanically or by physiotherapy in a chiropodic manner the human foot, S 75, granting hospitals, supported in whole or in part by private charities and treating persons injured through the negligence of others, liens on all rights of actions, claims, judgments, compromises or settlements accruing to the injured persons because of their injuries.

OHIO

The Rachford Lectures—Dr Roy G. Hoskins, director of the Memorial Foundation for Neuro-Endocrine Research, Boston, delivered the fifth annual series of Benjamin Knox Rachford Lectures at the University of Cincinnati College of Medicine, March 21 and 22. His subjects were "Endocrinology of Today" and "Endocrine Factors in Personality."

Graduate Program at Akron—The Summit County Medical Society held the first of four "Post-Graduate Days" planned for this year, February 20, at the Akron City Hospital. Sessions occupied the afternoon and evening and were attended by 180 physicians from fifteen towns. Among the presentations were the following:

Treatment of Tuberculosis in the Home Dr Clarence L. Hyde
Nontuberculous Pulmonary Infections Dr Joseph A. Weiler
Traumatic Conditions of the Bladder and Urethra Dr Charles E. Jelm
Skull Fractures and Injuries to the Head Dr Walter A. Hoyt
X Ray Diagnosis of Gastric Ulcers Dr Arthur H. Stall

Dr Charles E. Updegraff was chairman of arrangements for this program. The next will be held at People's Hospital in April.

Dr Tuckerman Honored—The Cleveland Academy of Medicine at its meeting February 18 awarded the title of honorary secretary for life to Dr Jacob Edward Tuckerman in recognition of thirty-three years of continuous service to the academy in various capacities. Dr Howard Lester Taylor, president, presented to Dr Tuckerman an illuminated parchment on which was inscribed the action of the society, and Dr George E. Follansbee paid tribute to his long service. Dr Tuckerman became a member of the academy in 1903 and was appointed an alternate delegate to the Ohio State Medical Association the same year. From that time he has constantly maintained an official position, ranging from committee membership to the presidency of the academy.

OKLAHOMA

Bill Enacted—H 126, proposing to create a board of chiropody examiners and to regulate the practice of chiropody has become a law.

Bill Passed—H 46 has passed the house and the senate proposing to require every hospital or physician treating a patient suffering from an injury caused by the discharge of a gun to report the facts to the proper police authorities.

Medical Assembly in Muskogee—The Muskogee Academy of Medicine sponsored a two day medical assembly, Feb-

ruary 26-27, with the following guest speakers, among others Drs Ernest Sachs, St Louis, William T Pride, Memphis, John O McReynolds, Dallas, Arthur G Schoch, Dallas, Barton A Rhinehart, Little Rock, Ark, and Sidney J Wolfermann, Fort Smith, Ark. A public meeting was held in the evening of February 27, at which Dr McReynolds and Dr Leroy Long, Oklahoma City, president, Oklahoma State Medical Association, were the speakers on care of the eyes and medical care of the indigent, respectively. Dr Long made an address at a dinner given by the academy for the guests, on "Medical Integrity."

OREGON

Bills Passed—H 440 has passed the house and senate, proposing to amend the law requiring a male applicant for a license to marry to present a physician's certificate showing freedom from venereal disease and from mental illness or defect, by requiring such certificate from both parties to a proposed marriage. H 373 has passed the house and the senate, proposing to authorize the state board of health to make such rules and regulations as it deems necessary for the operation of laboratories in which human or animal body fluids, secretions or excretions are examined for the determination of the presence or absence of an infectious agent. Every person, corporation or municipal corporation maintaining such a laboratory is to be required to register annually with the state board of health.

PENNSYLVANIA

Bills Introduced—S 490 proposes to authorize the sterilization of certain socially inadequate inmates of state institutions. H 1262 proposes to make the records of any hospital concerning the stay and treatment of patients therein admissible in evidence in court for all intents and purposes without further proof thereof than their authenticity.

Society News—Dr John A Kolmer, Philadelphia, addressed the Cambria County Medical Society, March 14, on "Syphilis from the Standpoint of the General Practitioner."—Drs James J Jefferson and Joseph P Replogle, Johnstown, addressed the Westmoreland County Medical Society, February 14, on "Infections of the Hand and Forearm" and "Causes of High Mortality in Appendicitis," respectively.—Dr Leon G Zerfas, Indianapolis, addressed the Harrisburg Academy of Medicine, March 19, on "The Anemias."

Philadelphia

Anders Lecture—Dr Milton J Rosenau, Charles Wilder professor of preventive medicine and hygiene, Harvard University Medical School, Boston gave a James M Anders Lecture before the College of Physicians of Philadelphia, March 6. His subject was "Specific Treatment and Prevention of Pneumonia."

Personal—Dr Ella B Custer, who has practiced medicine for more than fifty years, was designated the outstanding citizen of the twenty-first ward in 1934 with the presentation of a silver plaque by the Roxborough-Manayunk Lions Club, February 25. The honor was the first of its kind and is to be an annual event hereafter.

SOUTH DAKOTA

Bill Passed—H 213 has passed the house and senate, proposing to repeal the laws regulating the sale, distribution or possession of narcotic drugs and to enact what apparently is the uniform narcotic drug act.

New Plan for Relief Administration—South Dakota physicians and the state relief committee have inaugurated a new plan of budgeting federal relief money to the separate counties according to the number of families on relief. As conditions change each month, the amount will fluctuate, the *Journal-Lancet* reports. Two physicians and one dentist have been appointed in each county to audit all bills and recommend to the county relief directors the amount due each physician, dentist, nurse and pharmacist each month. When the bills for medical service exceed the budget, the amount available will be distributed pro rata.

TEXAS

Bill Introduced—H 640 proposes to make it the duty of parents or legal guardians of a child between 6 and 18 years of age to have the child examined to determine whether or not he has a defect in either sight or hearing such as to prevent him from receiving the full benefit of school work.

Society News—Speakers at the meeting of the Dallas County Medical Society, March 28 will be Drs John L Goforth, on "Cancer of the Uterus from the Pathologist's View-

point", Charles Frank Brown, "Hypothyroidism in Pregnancy," and James G Poe, "Convulsions During Operation Under General Anesthesia."

VERMONT

Bill Introduced—H 288 proposes to accord to physicians, hospitals and nurses treating persons injured through the fault of others liens on all rights of action, claims, judgments, compromises or settlements accruing to the injured persons by reason of their injuries.

Bills Passed—H 264 has passed the house, proposing to supplement the chiropractic practice act, by permitting the board of chiropractic examiners to revoke the licenses of licensees or to refuse licenses to applicants who have been convicted of criminal abortion or who have been guilty of professional or dishonorable conduct, which the bill states is (1) advertising which has a tendency to deceive the public, (2) conviction of any offense involving moral turpitude, (3) habitual intemperance and (4) habitual use of habit-forming drugs. H 162 has passed the house, proposing to limit to licensed physicians and registered pharmacists the retail sale or distribution of articles or medicinal preparations that may be used as prophylactics or contraceptives.

WASHINGTON

Bills Introduced—H 580 proposes to establish a state hospitalization board to provide for the construction, operation and maintenance of experimental hospitals, clinics and outstations in King County, in Clallam County, and in the eastern part of the state. Apparently, all types of medical and dental services are to be available without cost to the public in the hospitals, clinics and outstations just noted. Establishment of these experimental units is to be conditioned, however, on the receipt from the Federal Emergency Relief Administration of \$500,000 and the expenses of the experimental units are to be financed entirely from this fund. The state hospitalization board is also to propose to the 1937 session of the legislature a complete plan for dividing the state into hospital districts and for establishing and maintaining an adequate public hospital system within each of the districts to be established. H 583 proposes to create a social service department of the state of Washington to render free medical, hospital and dental services "of all kinds known to science in all cases of sickness, accident, and childbirth to all residents of the state." The department is to have the power to take over all hospitals, public and private, in the state. All physicians in the state are to treat under the direction of the department and are to be paid an annual salary in accordance with the number of years during which they have been licensed to practice medicine. Every person "earning a living" is to be obliged to make monthly contributions to the state of from \$2.50 to \$5, depending on the number of persons dependent on the individual. S 331 proposes to regulate the practice of naturopathy and to create an independent naturopathic examining committee. Licensees are apparently to be permitted to practice obstetrics, "traumatic" surgery and minor surgery, and to use anesthesia in obstetric and traumatic and minor surgical cases.

WISCONSIN

Bills Introduced—A 414 proposes that any person declared by the state board of health to be a typhoid carrier, who does not conduct himself in the manner required by the board, may be committed to any institution where proper care and maintenance can be provided and may be confined until the board consents to discharge. If a typhoid carrier is prevented from engaging in any gainful occupation, he may be awarded up to \$30 a month to compensate him for loss of earning power. A 421, to amend the laws relating to the practice of chiropractic, proposes to provide that the provisions of the basic science act shall not apply to applicants for licenses to practice chiropractic. The bill proposes that the chiropractic board, instead of the basic science board, examine such applicants in anatomy, physiology, pathology and diagnosis. A 422 proposes to amend the laws relating to the practice of chiropractic so as to raise the annual registration fee required of chiropractors to \$5 and to make the annual registration of a chiropractor contingent on his attending within the preceding year at least one of the two-day "educational" programs conducted by the Wisconsin Chiropractic Association. A 451 proposes to create a board of naturopathic examiners and to regulate the practice of naturopathy. All present practitioners are to be issued a certificate of registration in the basic sciences without examination and are to be licensed by the naturopathic board also without examination.

GENERAL

Early Diagnosis Campaign—The National Tuberculosis Association is sponsoring its annual early diagnosis campaign beginning April 1. The campaign will be carried on this year with the slogan "Fight Tuberculosis with Modern Weapons" and will stress particularly the fact that "the treatment of tuberculosis in all cases must be based on diagnosis."

Admiral Grayson Named Chairman of Red Cross—Admiral Cary T. Grayson, Washington, D. C., has been named chairman of the American Red Cross, succeeding the late John Barton Payne. Dr. Grayson is a graduate of the University of the South Medical Department, Sewanee, Tennessee, class of 1903. In that year he joined the U. S. Navy Medical Department, with which he was associated until his retirement in December 1928 with the rank of rear admiral. He was attending and consulting physician to the Naval Dispensary, Washington, during the Roosevelt and Taft administrations, and served as physician to President Woodrow Wilson. Admiral Grayson is 56 years of age.

Advisory Service on X-Ray Technic—The National Tuberculosis Association announces that a study on the standardization of x-ray technic which it has conducted for the past ten years has now reached the point at which effective advisory service can be offered to the x-ray departments of hospitals and sanatoriums. The research has been done at the Moore School of Electrical Engineering at the University of Pennsylvania under the direction of Mr. Charles Weil. The objectives are based on the following principles, according to the announcement:

1. That a standardized system of technic determined on scientific bases should be used for the making of all diagnostic films in order to obtain (a) films having characteristics conducive to maximum interpretability and (b) films of the same patient which will be comparable when taken at different times and also when taken in different laboratories.
2. That diagnostic roentgenography should be accomplished with a maximum of economy in cost of apparatus, technical apparatus, technical manipulation and supplies with especial emphasis on economy in the number of films.

Registry of Physical Therapy Technicians—With the acceptance of applications of qualified technicians for examination, the American Registry of Physical Therapy Technicians, in process of organization for more than two years, has begun to function. Applications will be issued only on written request to the registrar, Marion G. Smith, B.S. Examinations will be held May 4 and July 13 in New York, Philadelphia, Chicago, St. Louis, New Orleans, Los Angeles and San Francisco and on September 9 in Kansas City. The registry was promoted to register and certify those technicians who meet its requirements. It is directed by a board of registry, composed of seven members:

- Dr. William Bierman, New York, chairman
- Dr. Harold M. F. Behneman, San Francisco
- Dr. John S. Coulter, Chicago, associate professor of physical therapy, Northwestern University Medical School, Chicago
- Dr. Frank H. Ewerhardt, St. Louis, assistant professor of physical therapy, Washington University School of Medicine, St. Louis
- Dr. John S. Hibben, Pasadena, Calif.
- Dr. Frank H. Krusen, Philadelphia, associate in medicine, Temple University School of Medicine
- Dr. Nathan H. Palmer, New Orleans, assistant professor of clinical medicine, Tulane University Graduate School of Medicine

In addition, there is an advisory board composed of representatives from national organizations interested in the work of physical therapy technicians and the physicians who use physical therapy in their specialties. This board is also composed of seven members. A regional board will comprise two or more members, according to the local requirements. There will be two classes of certification: physical therapy technicians and junior physical therapy technicians. A certificate may be revoked at the discretion of the board of registry, and all registered technicians and assistants will be required to comply with the code of ethics as defined by the American Congress of Physical Therapy.

Society News—The annual meeting of the American Association on Mental Deficiency will be held at the Palmer House, Chicago, April 25-27. Physicians are invited to attend all sessions. Complete information on the program may be obtained from Dr. Groves B. Smith, secretary, Godfrey, Ill.—Dr. Ralph C. P. Truitt, Baltimore, was elected president of the American Orthopsychiatric Association at the annual meeting in New York, February 22-23. Willard C. Olson, Ph.D., Ann Arbor, Mich., vice president and Dr. George S. Stevenson, New York, secretary.—The twentieth annual convention of the Catholic Hospital Association of the United States and Canada will be held at Creighton University, Omaha, June 17-21.—The twenty-third annual meeting of the Eugenics Research Association will be held at the American Museum of Natural History, New York, June 1.—The annual meet-

ing of the National Medical Association will be held in New Orleans, August 11-17.—The twenty-fourth annual National Safety Congress will be held in Louisville, Ky., October 14-18.—The Eastern Section of the American Congress of Physical Therapy will meet in Baltimore, March 29-30. The program will open in joint session with the Baltimore City Medical Society and will be presented by the following physicians, among others: Drs. Frank H. Krusen, Philadelphia, "Light Therapy"; Henry H. Ritter, New York, "Physical Therapy in Traumatic Surgery"; William Bierman, New York, "Short Wave Therapy"; Thomas P. Sprunt, Baltimore, "Physical Therapy from the Standpoint of the Internist," and Allen F. Voshell, Baltimore, "Treatment of Delayed Union of Fractures."

Medical Bills in Congress—Changes in Status H. R. 2827 has been reported to the House (Rept. No. 418). The bill proposes to direct the Secretary of Labor to provide for the immediate establishment of social insurance to provide compensation for all workers and farmers who are unable to work because of sickness, old age, maternity, industrial injury or other disability. H. R. 6718, the Agricultural Department appropriation bill, has been reported to the House (Rept. No. 385). This bill among other things, authorizes an appropriation of \$1,515,879 for the enforcement of the Pure Food and Drugs Act, an increase of \$354,402 over the appropriation for the preceding fiscal year. S. 2024 has been reported to the Senate (Rept. No. 333). This bill would authorize the President to designate Colonel William L. Keller, Medical Corps, United States Army, on his retirement from the active list, as consultant in surgery at the United States Army Medical Center. **Bills Introduced** S. 2214, introduced by Senator Thomas Oklahoma and H. R. 6625 introduced by Representative Rogers Oklahoma, both bills being introduced by request propose to confer jurisdiction on the United States District Courts over Osage Indian drug and liquor addicts. H. R. 6688 introduced by Representative Hennings, Missouri, proposes to prohibit the sale, possession and transportation of cannabis and its derivatives and compounds, except when sold, possessed or transported for medicinal and lawful uses by the producer or manufacturer thereof or dealer therein to licensed physicians, surgeons, dentists, pharmacists, druggists and veterinarians, under such rules and regulations as may be prescribed by the Commissioner of Narcotics. H. R. 6769, introduced by Representative Hoepfel California, proposes to grant the benefits of veterans legislation to maimed, blind or helpless retired personnel of the Army, Navy, Marine Corps and Coast Guard, in the furnishing of artificial appliances and allowance for attendants.

Government Services

Acting Director of Division of Maternal and Child Health

Dr. Ethel C. Dunham, associate clinical professor of pediatrics, Yale University School of Medicine, New Haven, has been named acting director of the division of maternal and child health, U. S. Children's Bureau. Dr. Dunham graduated from Johns Hopkins University School of Medicine, Baltimore, in 1918. For the past eight years she has devoted much of her time to research on the diseases of new-born infants.

Examination for Entrance to Public Health Service

The U. S. Public Health Service announces that an examination will be held, April 8, for entrance into the regular corps of the service as assistant surgeon. Applicants must be graduates of class A medical colleges and under 32 years of age. They must have completed a year's internship or have had two years of private practice by July 1. Sub-boards will be appointed for the examination so as to eliminate travel as far as possible, which if necessary must be made at the candidate's expense. Physicians who wish to take this examination should make a request to the surgeon general, U. S. Public Health Service, Washington, D. C., for the necessary forms and other information.

CORRECTION

Nobel Prize Winners in Medicine—The name of Dr. William P. Murphy of Boston was inadvertently omitted in the Current Comment entitled "Nobel Prize Lectures on Anemia" in THE JOURNAL, March 9, page 838. The Nobel Prize for 1934 in medicine was awarded conjointly to Drs. Minot, Murphy and Whipple for their work on anemia.

A Salaried Service of Municipal Midwives

The Joint Council of Midwifery, which is representative of the important medical and nursing societies, has issued a report on the desirability of establishing a salaried service of midwives, under the local authority in all areas not already served by salaried midwives. The cost of the service, as far as practicable, is to be met by fees charged by the authority of local voluntary organization for the services of the midwife. The council holds that the nursing in every maternity case should be conducted by a qualified midwife and that unqualified persons should not be permitted to nurse in maternity cases for gain. It should be the duty of the local authority to provide that midwives are available as maternity nurses for any patient who has engaged a physician for her confinement but is unable to afford this additional expense. But it is not intended to interfere with the continuance in practice of independent midwives. Midwives entering this municipal service should receive adequate pay, allowances and pension rights and be accorded the same status in every respect as health visitors. The average number of cases that a midwife would be expected to attend should not exceed eighty a year. After this new act has come into operation the local authority should require that midwives in independent practice who, from age or physical or mental infirmity are unable to carry out satisfactorily midwifery practice, retire on receiving an adequate pension. Every midwife should be required to take a refresher course, including, if necessary, two months' residence in a training institution, at intervals not exceeding seven years.

THE INADEQUACY OF THE PRESENT REMUNERATION OF MIDWIVES

Owing to the large number of midwives in practice and the necessarily small fees paid by poor persons, the remuneration of midwives is entirely inadequate. The estimated number of salaried midwives now is 6,255 and of independent midwives 9,187. In 1929 a government committee, which reported on the training and employment of midwives, gave the average number of cases attended per midwife as slightly over forty and suggested that the average gross earnings varied from \$450 to \$600 a year. It is estimated that the position is much worse today, the average being estimated at \$400 and in some cases as low as \$250. Assuming that in future a midwife will attend every case, whether a physician is in charge or not, the number of municipal midwives likely to be required is estimated at 4,000. In addition, part time midwives or district nurses would probably have to be retained by means of a subsidy in semi-rural areas not covered by nursing associations.

Hugh Owen Thomas and an American Surgeon

In the months before his death in 1933, Sir Robert Jones discussed with his son-in-law, Mr Frederick Watson, the publication of a centenary volume on the life and principles of Hugh Owen Thomas, his uncle and teacher. A personal study of Thomas by Mr Watson has now been published, and a companion book on Thomas's surgical work by Mr McCrae Aitken, an orthopedic surgeon and colleague of Sir Robert Jones, is in preparation. Though this biography has been so long delayed—Thomas died in 1891—no man deserved one more and no achievement in the whole range of surgery is more interesting. A frail little man, who for thirty years carried on an arduous general practice among the poor of

Liverpool dockland without ever taking a holiday and without the advantage of a hospital appointment, revolutionized the treatment of tuberculous joints and laid a large part of the foundation of modern orthopedic surgery. The son of a Welsh bone setter and descended from a line of bone setters, he was regarded as one by the surgeons of his day and looked down on. It is interesting that an American surgeon, John Ridlon, was one of the first to appreciate Thomas's work. Mr Watson quotes Dr Ridlon's description of his first visit to Thomas in 1887: "I said 'Mr Thomas, I have read your book on hip, ankle and knee and I have come over 3,000 miles to find out whether I am a fool or you a liar.' There was a twinkle behind the thick lenses and he said 'I think we'll find that out in half an hour.' Thus began two wonderful days. He let me follow him to every patient." Later Dr Ridlon visited the clinics of all the well known orthopedic surgeons in Great Britain, and this is his verdict: "Not one of them had a kindly word to say of Thomas. But I was able to compare their work with his. One could gain more useful knowledge following Thomas around for an hour than elsewhere in Great Britain for months." In 1933 Dr Ridlon wrote: "To my mind one of the greatest things Robert Jones ever did was to make the main principles of Hugh Owen Thomas acceptable to the profession." It is interesting in this connection that the importance of Jones's work was appreciated in other countries and particularly in America earlier than in England. The same was true of Lister. It was not until the war that Jones reached the pinnacle of his fame.

Financing Hospitals by Sweepstakes

In previous letters, details were given of the immense sums obtained for Irish hospitals by taking advantage of the gambling spirit of the world. The latest estimate, given by Sir John Gilmour the home secretary, in parliament shows that approximately \$224,500,000 had been subscribed up to 1934 and that of this sum \$38,000,000 has been allocated to hospitals. The greater part of the difference between these two sums is due to prizes (about two thirds of the total subscribed), expenses and a considerable sum in the form of revenue charged by the Free State government. The greater part of the money comes from other countries than Ireland and the major part of this from Great Britain. An attempt is now being made to stop this drain by making the sale of sweepstake tickets illegal in Great Britain, with what success cannot yet be said. Evasion of course is not difficult.

Steel Hats for Miners

During the great war, steel helmets were introduced to prevent the many serious casualties of bullet wounds of the head. It is curious that the value of this device for coal miners, of whom thousands are injured every year in this country by the falling of rocks, has not previously been recognized. During the last few days the unfamiliar figures of miners in black steel helmets has been seen in the streets of the Derbyshire and Notts colliery towns. Insurance companies and mine owners are now making arrangements for the general use of these helmets. They recognize that this will mean fewer compensation claims. Experiments have been made to produce the lightest and most efficient head protection, and a helmet has been produced which weighs only 12 ounces and will withstand a weight of 9 pounds dropped from a height of 8 feet. The helmets have a shield to protect the neck and are covered with a special composition. The steel lining is of great strength. The helmets cost 66 cents, of which the miners pay 18 and the insurance companies and the mine owners 24 cents each. Other protective devices being introduced are specially made gloves to prevent hand wounds and reinforced boots to prevent foot injuries.

PARIS

Feb 15 1935

Transfusion of Refrigerated Citrated Blood

In Paris, the transfusion service is well organized. One of the many large public hospitals serves as a center from which grouped and adequately tested donors are available at all times. This service will be described in a future letter. In smaller cities such as Bordenx in the south of France, an effort has been made to utilize the blood of donors (universal group) which has been collected in flasks and kept liquid with the aid of a 10 per cent sodium citrate solution.

Jeamery and Vicroz, at the Dec 5 1934, meeting of the National Surgical Society, reported the details of how such blood is kept in a refrigerator at 2 C (35.6 F). The blood can be utilized only during a period of twenty days after being placed in the refrigerator.

In only six of seventy cases were any reactions observed in the form of a severe chill with slight fever (one case), slight chills without fever (four cases) and a feeling of paresthesia (one case). The simplicity of the technique of collecting the blood and its administration renders it available for city hospitals, where much time may be lost in making the various tests, especially those for syphilis.

Examination of the refrigerated blood reveals no changes in its components.

Prevention of Tuberculosis with BCG Vaccine

As a tribute to the memory of his associate Professor Calmette, Professor Guérin reported, at the January 15 meeting of the Academy of Medicine, some statistics on the employment of the BCG vaccine in France.

During the first ten months of 1933 there were 110,486 primary vaccinations and 13,909 revaccinations, during a similar period in 1934 the number of primary vaccinations had risen to 136,544 and of the revaccinations to 20,819. Vaccination of children over 2 years of age and of adults who do not react to tuberculin was begun towards the end of 1933. It consists in giving, by mouth, one ampule of the vaccine, 1,516 cases have been treated by this method. Boisseau and Nodenot in France and Scheel in Norway have shown that over 50 per cent of adults become allergic after being given the vaccine in this way. No ill effects have ever followed use of the BCG vaccine. The mortality from all causes of infants between the ages of 1 and 12 months is one half less in the case of those who have been than in those who have not been vaccinated. In families in which tuberculosis exists, the morbidity is eight times less in infants who have been than in the case of those who have not been vaccinated. The distribution of vaccine has been authorized in thirty-four countries exclusive of France. With the exception of a few countries in which vaccination is limited to children born of tuberculous parents or obliged to live among tuberculous individuals, all these countries extend the vaccination to all children, whether they live in surroundings where there is danger of contagion or not.

Failures in the use of the BCG vaccine as a preventive measure against tuberculosis are due to three causes:

1. There are a certain number of individuals who are refractory to any type of vaccination, such as that against typhoid or smallpox. An explanation of why persons in this group do not develop immunity is still lacking.

2. It is essential to remove new-born infants, who have been vaccinated, for a period of at least six weeks from contact with tuberculous individuals.

3. The majority of pathogenic organisms are destroyed and carried away by phagocytosis. This is not true for the tubercle bacillus and can be demonstrated experimentally. Calmette and

Guérin have shown that in animals as well as in human beings the tubercle bacilli are excreted by the bile in both sexes and also by the mammary secretion in the female. In persons vaccinated with the BCG vaccine, and who then are subjected to virulent additional tuberculous infection, the bacilli are eliminated often without giving rise to macroscopic lesions. In the case however, of severe and prolonged infections, if the number of bacilli that are absorbed is a larger amount than the organism can normally eliminate there will be an "accumulation" of tubercle bacilli in the lymphatics and a possible production of genuine tuberculous lesions which however are usually of a character that do not develop.

The part played by these three causes of resistance to vaccination has been demonstrated by animal experiments, especially those of the bovine type. It is probable that the same processes explain the resistance in the human being.

Complications of Pregnancy

Some interesting cases were reported at the Nov 5, 1934 meeting of the Paris Obstetric and Gynecologic Society by Le Lorier and Levy-Solal.

Le Lorier reported a case of a woman, aged 40, in whom labor during her first pregnancy had been induced because of a severe influenzal bronchopneumonia. During a second pregnancy, severe pyelonephritis showed no improvement after the use of indwelling ureteral catheters for fifteen days. The pregnancy was interrupted at the fifth month because of uremic symptoms and high blood urea. Spontaneous expulsion of the fetus occurred during the third pregnancy, complicated by recurrence of renal infection. Premature delivery during the fourth pregnancy was also accompanied by pyelonephritis of less intensity. Following this pregnancy, the blood urea gradually decreased during a period of three years from 279 mg per hundred cubic centimeters to practically normal, 45 mg. During the fifth pregnancy the blood urea was only 38 mg per hundred cubic centimeters. The patient was given a diet of vegetables, cereals, fruits and fermented milk. The pregnancy was without incident and she was delivered of a normal child at term. The case illustrates the gradual decrease in intensity of the renal infection in spite of evidence of an involvement, at an earlier period, of the renal parenchyma. The latter, although very marked during the fourth pregnancy, had also improved.

A similar case was reported by Levy-Solal, Sureau and Lauret. The patient was first seen during the sixth month of pregnancy during an attack of severe renal infection with a blood urea of 170 mg per hundred cubic centimeters. But little improvement followed the use of indwelling ureteral catheters, although some retention had been found on both sides at the first ureteral catheterization. The blood urea rose as high as 250 mg per hundred cubic centimeters. The estimation of chlorides in the blood (globular and plasma) revealed a ratio only slightly below normal. To restore the ratio to its normal figure, rechloridation was instituted in the form of salt solution given both subcutaneously and intravenously. The persistent emesis ceased and the diarrhea decreased markedly but the general condition was so alarming that evacuation of the uterus seemed indicated, but labor occurred and a living child weighing 1,700 Gm was born. The blood urea, which was 250 mg on the day of the confinement, decreased to 38 mg on the tenth day. The use of indwelling ureteral catheters was of no benefit in this patient. The high percentage of blood urea and its rapid recession seem to indicate that the renal parenchyma has not been seriously affected. The high blood urea was apparently only a temporary phenomenon, comparable to similar observations in postoperative cases. The rechloridation relieved the vomiting and diarrhea but had no influence on the high blood urea but such treatment is to be recommended whenever indwelling catheters do not give relief and the blood urea remains

high Emptying the uterus is indicated when neither urologic methods nor rechloridation result in a drop in the high urea content of the blood

A third instructive case, which raises the question as to the existence of supernumerary ovaries, was reported by Levy-Solal, Sureau and Lauret. The patient was a primipara, aged 21, who was in the first stage of labor on admission to the hospital, without engagement of the head. A mass the size of a large orange could be felt in the posterior culdesac, independent of the uterus. A diagnosis of ovarian cyst obstructing the head from entering the pelvis was made, and laparotomy was decided on. It revealed the presence of a dermoid of the right ovary, the size of an orange, with a short pedicle. A similar cyst of the left ovary, the size of a child's head at term, was present, a portion extending into the culdesac of Douglas. Not the least trace of ovarian tissue was visible, even on microscopic examination of the two dermoids. Either the dermoids must have developed during the pregnancy or there had been a supernumerary ovary. Various authors estimate that these are present in 4 per cent of women. These supernumerary ovaries are found attached to the ovary or they occur somewhere along the line of migration of the ovary in the embryo. They may be multiple and of variable size. Their presence explains the persistence of menstruation after bilateral ovariectomy.

On account of the patient's age, a cesarean section was performed after removal of the bilateral ovarian dermoids and an infant weighing 3,000 Gm was delivered.

In the discussion, Faure reported a similar case in a woman, aged 28. Following removal of the dermoid cysts on both sides in the sixth week of pregnancy, the woman was delivered at term.

Reorganization of Student Activities in the Universities

A recent letter (THE JOURNAL, January 12, p. 132) gave an account of the struggles that have been going on in the student bodies of the universities. Since then, many changes have been made that will lead possibly to a greater stability. The struggle for supremacy, fought out between the German student body, as represented by certain student fraternities, and the national-socialist party, has been ended now by an executive order from the federal minister of public instruction (Rust). This decision releases the German student body from the duty of participating in the special training course designed to develop political insight and broader world views. This duty now need be fulfilled only by the members of the National-Socialist Student League. The purpose of this training is to create uniform political and world views to aid the students in forming their opinions. The general student body will not be compelled to enter a "kameradschaftshaus," as was originally planned. The fraternities have secured unquestionably greater liberty of action, although they are not permitted freely to air their political views. In keeping with this decision the director of the National-Socialist Student League has declared that the semester must be devoted primarily to scientific study and that he is opposed to the suggestion that "in the form of weekly political lectures the students receive from one to one and a half hours of instruction in national socialism, as such a plan might lead to a degeneration of our intellectual life and to false conceptions of the true aims of a university." This denotes a wide departure from previous uses. During the vacations, however, the students will be brought together in camps, where they will receive such training as will make of them "true champions of national socialism." This director makes then some interest-

ing confessions. "During the past year and a half, the student has been tossed about to such an extent that he has lost most of his faith in attempts to direct the thinking of students. A reawakening of this faith I regard as a necessity, since leadership without the confidence of one's followers is not true leadership but dictatorship."

The Deutsches Studentenwerk, a self-help organization for the aid of needy students, for whom the society procures opportunities to make a little extra money, has been reorganized by ministerial decree and placed under the control of the ministry. Its announced purpose now is "to provide every person possessing high intellectual gifts, irrespective of origin or financial status, an opportunity to attend a German university." The society receives now, in addition to voluntary contributions, certain sums from the students and from the government. It has, however, lost the right to administer its own affairs.

University Sports

With the beginning of the winter semester, the new university regulations pertaining to participation in sports went into effect in all the universities of the reich. Compulsory participation in gymnastic exercises and various sports, during the first three semesters, deserves special mention. Only in exceptional cases will students be excused from such participation (time spent in the arbeitsdienst, or work service, may be taken into account). The fundamental training for both sexes, during the first semester, consists of general body building, work in the gymnasium, cross country runs (sometimes in groups), in the second semester, of the so-called *funfkampf-training*, and rifle practice, and, in the third semester, of group contests, swimming exercises and practice that will fit them for the rescuing of drowning persons. In the future, no student who has not met the requirements of the "fundamental training" will be permitted to continue with the studies of the fourth semester or become a candidate for any degree. After fulfillment of these conditions, a student will receive a badge. It is also planned to organize special sport events of the universities.

University Study Without Attendance at a "Gymnasium"

In a few special cases persons will be permitted to enter a university without having previously attended a "gymnasium." The minister of public instruction, in order to afford a few of the most talented sons of workmen an opportunity to attend a university, has consented, at the request of the German student organization, to allow twenty members of the "Hitler-Jugend" and of the Arbeitsdienst (work service) to be admitted to the student body without presenting a diploma of a "gymnasium." Under certain conditions they may be permitted, after two semesters, to matriculate as regular students. The intellectual training of these workmen's sons will be carried on with the cooperation of the student organization and the Deutsche Dozentenschaft, or association of faculty members. The funds for such university study will be furnished by the Deutsches Studentenwerk. For the training of these candidates the universities of Heidelberg and Königsberg are being considered.

University Entrance Requirements

According to an agreement between a Hitler-Jugend "führer" (leader) and the local school authorities, remission of the university entrance requirements, which for some time have been based on conditions quite apart from performance in school (THE JOURNAL, March 3, 1934, p. 710), is to be determined by considerations that concern the political usefulness, together with his type of character and his personal qualities. But the decision in such cases will not rest with the school but with

the fulcrum of the Hitler Jugend. Such an understanding would make it possible to help such fulcrum to make up their deficiencies even though their performance might be only barely "satisfactory." This agreement is in line with a tendency manifest in the Hitler-Jugend to make university distinctions a political football, and it throws a floodlight on certain endeavors to bring German youth entirely under certain definite influences. The university authorities, however, in spite of their sympathy for the cause of the people, will hardly be willing to accept any such provisions.

Selective Diets in Hospitals

The experiences with a uniform diet for most patients in hospitals have not been universally satisfactory. In some institutions of Berlin an experiment has been made with an à la carte service, which permits the patients to choose the food they desire or which is prescribed. The results of this experiment are considered satisfactory, for example in the Virchow Hospital, which has had a longer experience with the new system than some of the other institutions now using it. On an average, this hospital serves meals to 2,400 persons daily, including physicians and hospital personnel. Of this number from 1,400 to 1,600 persons are served diets I or II, which permit the use of all foods, except possibly a few of the vegetables that are hard to digest. Diets III and IIIa presuppose a certain amount of selection. The old plan of serving uniform meals to all patients gave rise to many complaints. At first, the experiment was tried of serving the tuberculous patients, who are particular about their food, a selective diet, allowing them the choice of one of two articles. The complaints in this department ceased immediately. The experiment was then tried in other departments with equal success. Hence the new system was extended to all departments and at the same time the number of meals at which a selective diet was permitted was extended to three a day. No complaints have developed since the introduction of the new system. There is no doubt that a diet satisfactory to the patients contributes to their recovery and influences their general well being. This selective system makes it possible to take some account of local peculiarities and special dishes, which are very marked in many parts of Germany. With the former uniform diet menus calling for large amounts of meat were very expensive. After introduction of the selective diet there was no difficulty in offering a diet rich in meats, for it was found in a short time that the selective diet entails much less expense than the uniform diet, for which fact several reasons may be assigned. Principally, with the introduction of the selective diet the expensive system of *zulegen* (certain side dishes) was abolished. Formerly the uniform diet was supplemented, if desired, by side dishes in the form of sweets, desserts, fruit, and the like, in order to give more variety to the meal. This system, however, added a great deal to the general expense. Now the patients have accepted the discontinuance of the side dishes as a system without complaint. Another source of economy is the fact that, under the new system, certain cheaper foods of high quality can be served more frequently than under the old system, since the patients do not need to select them unless they desire.

German Spanish-American Medical Academy

In order to foster better relations between the German reich and the South American countries the Deutsch-Ibero-Amerikanische Gesellschaft in Berlin is planning the creation of a medical academy. The idea is to establish in Berlin with the cooperation of well known physicians and institutions of the reich, a special center that, it is hoped, will be of a nature to induce more physicians and patients from foreign countries to visit German cities and health resorts.

JAPAN

(From Our Regular Correspondent)

Jan 26, 1935

Outbreak of 1,000 Cases of Dysentery

In the city of Kawasaki, between Tokyo and Yokohama, with a population of 141,800, 1,258 dysentery cases occurred from January 2 to January 21. There first appeared all over the city children with symptoms of influenza accompanied by slight digestive trouble. After January 6, this disease began to attack the adults. On investigation, the disease was found to be dysentery. There were 147 deaths, and there are now more than 800 persons ill, but there is no sign of a further increase. The cause of the outbreak was at first thought to be the water, but no bacteria were found in it.

An Investigation of Encephalitis

At a meeting of the Japan Science Society, January 21, in Tokyo Dr. Y. Imura of the committee on encephalitis made a report after one year of research. Encephalitis breaks out here in August and decreases gradually toward September, two thirds of the outbreaks in the last ten years have taken place in August. The cases are found mostly in the western provinces. Many of the victims are professional workers, and the heads of families more often than other members. More cases are seen in the better class houses in high and dry places than in the low and damp places. When it is hottest, this disease occurs mostly in the villages, but when it is cooler, more are found in factory towns. After hard labor, mental or physical, especially in a burning sun, many have taken sick. It is still obscure whether the disease is infectious or not. Of the deaths during the last ten years, 64.8 per cent were among old women. The disease causes death in five days on the average when it is very hot. The density of population seems to have little to do with this disease. The heat of the previous month appears to have a great influence, for instance, when August is especially hot in some district, many cases have occurred there in September, a tendency present almost everywhere throughout the country. A relation between the disease and the rainfall has been noted. Less moisture and a longer period of sunshine cause a greater number of cases.

Professor Kubo Retires

It is widely regretted that Prof. Dr. Ino Kubo of the Kyushu Imperial University has reached the age limit and has to resign. For the first time in this university, a ceremonial clinical lecture was given by him, December 13, at the otorhinolaryngology lecture hall, which was founded by him in 1907. His last lecture was demanded by students of the lower classes who had never heard him lecture. The hall was overcrowded with students and graduates an hour before the lecture began. Those who couldn't get in filled two other halls, where they heard his lecture through loud speakers especially installed for the purpose. His subject was "The Essentials in Clinicians." He said "To summarize my twenty-eight years of experience acquired in this room, I have examined during those years 133,539 outpatients and 16,941 inpatients. The spirit of my service to them will be described today.

The very first essential that we ought to have as clinicians is always to maintain a student-like attitude in diagnosing and treating patients. The second is that we should have the feeling of commiseration toward patients. Huefeland once said that the feeling of relieving a patient of his trouble is the principle of medicine. These I have had deeply implanted in my heart during these past years, trying ever to be faithful to them." He brought before the assembly eight persons who were cured of their trouble under his treatment recently. He explained each case, making a deep impression on every one present.

Nephritis and Nephrosis

Prof Polak Daniels has called attention to the difficulty of distinguishing, from the anatomopathologic point of view, the diseases that attack the epithelium of the renal tubules (nephrosis) and the disorders that provoke changes in the glomeruli (nephritis). Belle and McGregor hold, on the basis of histologic observations, that chronic lipoid nephrosis should be regarded as a special type of glomerulonephritis. If one seeks to superimpose the clinical picture of nephrosis and the anatomopathologic manifestations of this disease, it will soon be found that such superimposition is difficult if not impossible.

The cardinal symptom of nephrosis is the edema. Can the typical anatomic lesion of nephrosis (cellular degeneration of the epithelium of the renal tubules) be considered responsible for the edema? If one takes account of the more recent views of renal physiology, the reply will be negative. It will be recalled that the glomeruli are ultrafilters and that the renal tubules are charged with the resorption of a part of the substance secreted by the glomeruli (concentration function). If the epithelium of the tubules is diseased, the resorption of the liquid will be impaired, and as a consequence diuresis will be increased. The edema associated with nephrosis cannot therefore be considered a direct consequence of the lesions found in the renal tubules. Daniels believes that it is much more logical to explain albuminuria as a glomerular lesion than as a degenerative lesion of the renal tubules.

Syphilis in Infants

At the ninth *Congrès nationale des oeuvres de l'enfance*, which was held at Tournai, it was decided, following a paper presented by Dr Languy on "Syphilis in Infants: Diagnosis and Treatment," to apply all measures possible to intensify in Belgium the crusade against syphilis, which is an important factor in infant mortality. In this crusade there must be close and effective cooperation between the various organizations for detection, on the one hand (the prenatal consultation centers, the obstetric services, the consultation centers for infant care and the centers of preventive medicine in general), and, on the other hand, between the organizations on which the treatment develops, namely, the whole medical profession of Belgium, aided in its task by the antivenereal dispensaries.

International Congress of Accidents and Occupational Diseases

The seventh *Congrès international des accidents et des maladies du travail* will be held at Brussels in July 1935, under the chairmanship of Dr Glibert. The work of the congress will comprise official papers on the questions previously chosen for discussion.

Section A Surgery

I Remote results of traumatism of the cranium (a) etiology and symptomatology, (b) pathologic anatomy, (c) diagnosis, prognosis, evaluation and (d) treatment.

II Traumatism of the hand and the fingers (a) immediate treatment of wounds of the hand and the fingers, (b) infectious complications of such wounds, (c) reparative operations after these traumatism, (d) trophic and painful sequels, (e) estimation of disability caused by wounds of the hand and the fingers.

Section B Occupational Diseases

I The crusade against harmful dusts in industry (a) how to secure and to examine dusts in order to determine their quality and quantity, (b) the relative value of the different means of combating industrial dusts suspended in the air, (c) criteria for the selection, before hiring, of workmen to be

exposed to dangerous dusts, (d) the first alarming signs indicating an intolerance for a dangerous occupation.

II The pathologic action of gases escaping from fire-damp veins. Does the repeated inhalation of minimal amounts of gases escaping from fire-damp veins exert a pathologic action? (a) the nature of fire-damp, its detection and prevention, (b) the physiologic and pathologic effects of fire-damp.

Section C Miscellaneous

I (a) psychophysiology of pain, (b) pathologic changes in the sense of pain, (c) objective diagnosis of pain in traumatized persons.

II Electricity (a) pathologic disorders due to electricity, (b) hygiene of electricity, (c) pathologic anatomy, (d) injuries due to electricity.

Osteitis of the Pubis

Addressing recently the Belgian Surgical Society, Drs Jonckheere and Leclercq discussed the various forms of tuberculous osteitis occurring in the pubis. The two dominant factors in the evolution of osteotuberculosis of the pubis are the degree of gravity of the bone lesions and the stage (more or less advanced) of the abscess. They gave this therapeutic survey: 1 The nonsuppurative bone lesions may heal perfectly by the institution of a rational mobilization, combined with the general treatment of any tuberculosis. Unfortunately one seldom has an opportunity to apply such treatment, since tuberculous lesions of the pubis have at first a symptomatology that is obscure if not nonexistent. This method, however, should be borne in mind, for it may be advantageous to combine it with the surgical or orthopedic technique to which more serious clinical types are amenable. 2 Bone lesions with walled off collections require a different treatment, depending on whether or not there are sequestrums. The type without sequestrums, characteristic of diffuse or periosteal tuberculosis, should be subjected to modifying injections.

The typical form of circumscribed tuberculosis with sequestrums will necessitate a surgical intervention, which may be conservative or radical. If conservative, one will confine oneself to a curettage with removal of the pocket, in the second case one will undertake a symphyseal resection, which must be supplemented by an interpubic graft. 3 The bone lesions with fistulized collections constitute even to a greater extent a formal operative indication, consisting, as one may prefer, of a curettage or a pubic resection, either one of which will eliminate fistulous tracts.

Marriages

HELEN LA RUE WILLIAMS, Allentown, Pa., to Mr Frank Hollingsworth Hodgens of Philadelphia, February 2.

DANIEL EARL KAVANAUGH to Miss Elizabeth Marion Current, both of Belleville, N. J., January 26.

LEO L. JACOBS, Richmond, Va., to Miss Esther Bloom of Covington, Ky., in Norfolk, February 14.

ALLEN W. BARNES, Des Moines, Iowa, to Miss Elizabeth M. Early of Traer, Dec. 25, 1934.

JAMES S. McELROY, Indianapolis, to Miss Katherine Dillm of Washington, Ind., February 2.

DEWITT T. BOYD, Danielsville, Ga., to Miss Elsie Quattlebaum of Statesboro, recently.

JOHN FRANCIS HAMMOND to Miss Louise Sellergren, both of Chicago, February 24.

ROBERT M. HARBIN, JR. to Miss Charlotte Dean, both of Rome, Ga., February 16.

GEORGE A. GRINDE, Cumberland, Wis., to Mrs. Helen Cole in December 1934.

WILLIAM J. MURPHY, Milwaukee, to Miss Virginia M. Dunn Dec. 27, 1934.

Deaths

Jabez North Jackson ♂ since 1912 director of health of Kansas City, Mo., died, March 18, aged 66. Dr. Jackson was born in Labadie, Mo., Oct. 6, 1868. After attending Central College in Fayette, Mo., where he received the bachelor of arts degree in 1889 and the master of arts degree in 1890, he graduated from the University Medical College of Kansas City in 1891 and later did graduate work at the New York Polyclinic. From 1891 to 1895 he was demonstrator of anatomy and from 1895 to 1898 professor of anatomy at his alma mater, professor of surgical anatomy and adjunct professor of surgery, 1898-1900 professor of principles and practice of surgery and clinical surgery, 1900-1911, trustee, 1891-1911, and at one time president. From 1893 to 1898 he was assistant surgeon and surgeon in the Third Regiment of the Missouri National Guard and was a major and brigade surgeon of the United States Volunteers in charge of the Second Division Hospital of the Second Army Corps during the Spanish American War. Dr. Jackson was chosen President-Elect of the American Medical Association at the Dallas session in 1926, was President of the Association in 1927-1928 and was a member of the House of Delegates in 1903-1904, 1906, 1919, 1930-1931 and 1933. He was president of the Medical Association of the Southwest in 1898, of the Kansas City Academy of Medicine in 1900, of the Missouri State Medical Association in 1904 and of the Western Surgical Association in 1913. Among the other organizations of which he was a member were the American Surgical Association, the Missouri Valley Medical Society, the Pan-American Medical Congress and the American College of Surgeons. He was surgeon to the Kansas City General Hospital, the Reservoir Hospital and the Trinity Hospital. He was awarded the doctor of science degree from Park College in 1926 and the doctor of laws from the University of Missouri in 1927.

John Ruhrh ♂ Baltimore, College of Physicians and Surgeons of Baltimore, 1894, professor of pediatrics, University of Maryland School of Medicine, member and past president of the American Pediatric Society, the American Academy of Pediatrics and the Medical and Surgical Faculty of Maryland, past president and secretary-treasurer of the Medical Library Association, past president of the Research Society and the Osler Historical Society, visiting physician to the Mercy Hospital and the Hospital for Women of Maryland, consulting physician to the Church Home and Infirmary and the Bay View City Hospital, commissioner of public schools in Baltimore, co-author of "Diet in Health and Disease," "Dietetics for Nurses" and "Polymyositis," author of "Manual of Diseases of Infants and Children" and "Pediatric Biographies," editor of "Pediatrics of the Past," and "William Cadogan His Essay on Gout," associate editor of *Annals of Medical History*, contributed articles on "Pediatrics in Art" to the *American Journal of Diseases of Children*, aged 62, died March 10, in the Mercy Hospital, of arteriosclerotic hypertensive cardiovascular disease and cerebral hemorrhage.

Ralph Walker McDowell ♂ Medical Director, Captain, U. S. Navy, Washington, D. C., Jefferson Medical College of Philadelphia, 1905, in 1934 Member of the House of Delegates of the American Medical Association, entered the navy as an assistant surgeon in 1908 and was promoted through the various grades to that of captain in 1931. He was awarded the *Distinguished Service Medal* and was made a *Chevalier of the Legion of Honor of France* for service during the World War, professor of surgery at the U. S. Naval Medical School, chief of the surgical service at the U. S. Naval Hospital, consulting surgeon for the navy in the District of Columbia, fellow of the American College of Surgeons, formerly editor of the *Naval Medical Bulletin*, aged 52, died, February 22, of coronary thrombosis.

Robert Abrahams ♂ New York, College of Physicians and Surgeons, Medical Department of Columbia College, New York, 1891, formerly associate professor of medicine, New York Post-Graduate Medical School and Hospital, at various times on the staff of the Unity Hospital, Brooklyn, Rockaway Beach (N. Y.) Hospital and the Manhattan State Hospital, aged 73, died, March 2, of heart disease, at Pass-a-Grille, Fla.

Albert Bernheim, Philadelphia, Albert-Ludwigs-Universität Medizinische Fakultät Freiburg Baden Germany, 1890, University of Louisville (Ky.) Medical Department, 1897, member of the Medical Society of the State of Pennsylvania and the American Gastro-Enterological Association, aged 66, died February 15, in the Jewish Hospital, of paralysis agitans and pneumonia.

Lucius Deyampert McGehee, Hammond, La., Tulane University of Louisiana Medical Department, New Orleans, 1904, member of the Louisiana State Medical Society, past president of the Tangipahoa Parish Medical Society, for many years member of the parish school board, health officer of Hammond, aged 53, died, January 30, of pneumonia.

Frank William Stevens ♂ Bridgeport, Conn., Yale University School of Medicine, New Haven, 1900, fellow of the American College of Surgeons, served during the World War, for eleven years member of the board of health of Bridgeport, aged 61, on the staff of the Bridgeport Hospital, where he died, February 16, of carcinoma of the stomach.

Hubert Carlyle Dixon ♂ Leaksville, N. C., University and Bellevue Hospital Medical College, New York, 1916, fellow of the American College of Surgeons, past president of the Rockingham County Medical Society, served during the World War, on the staff of the Leaksville Hospital, aged 43, died, February 11, of coronary occlusion.

Andrew Joseph Sullivan ♂ Brockton, Mass., Tufts College Medical School, Boston, 1909, member of the New England Otological and Laryngological Society, fellow of the American College of Surgeons, served during the World War on the staff of the Goddard Hospital, aged 49, died, February 9, of bronchiectasis and heart disease.

Mordecai Edward Doughty, Slolomb, Ala., Chattanooga (Tenn.) Medical College, 1903, member of the Medical Association of the State of Alabama, formerly health officer of Slolomb and county health officer, at one time member of the city council and board of education, aged 59, died, February 3, in a hospital at Dothan, of septicemia.

Walter Lewis Barber, Waterbury, Conn., Bellevue Hospital Medical College, New York, 1873, member of the Connecticut State Medical Society, for many years member of the state board of medical examiners and city board of health, on the staff of the Waterbury Hospital, aged 83, died, February 14, of cerebral hemorrhage.

John William Foley, Denver, University of Michigan Department of Medicine and Surgery, Ann Arbor, 1894, member of the American Academy of Ophthalmology and Otolaryngology, served during the World War, aged 61, died February 17, in the Fitzsimons General Hospital, of cerebral hemorrhage.

Louis Andrew King, St. Joseph Mich., Saginaw (Mich.) Valley Medical College, 1903, member of the Michigan State Medical Society, served during the World War, formerly mayor of St. Joseph, on the staff of the Mercy Hospital, Benton Harbor, aged 65, died, February 1, of cerebral hemorrhage.

Foster Victor Brown, Sioux City, Iowa, Sioux City College of Medicine, 1905, member of the Iowa State Medical Society, past president and secretary of the Woodbury County Medical Society, on the staffs of the Lutheran and Methodist hospitals, aged 56, died, February 12, of cirrhosis of the liver.

Lee Jones, Blount Springs, Ala., University of Virginia Department of Medicine, Charlottesville, 1909, served during the World War, for many years on the staffs of the Goldsby King Memorial Hospital and the Selma Baptist Hospital, Selma, aged 53, died, January 11, of heart disease.

Lawrence G. Clayton, Central, S. C., University of Maryland School of Medicine, Baltimore, 1878, member of the South Carolina Medical Association, past president of the Pickens County Medical Society, aged 80, died February 17, of bronchopneumonia and acute dilatation of the heart.

James Edward Terry, Red Level, Ala., University of Alabama Medical Department, Mobile, 1902, member of the Medical Association of the State of Alabama, chairman of the school board, aged 59, died, February 5, in St. Margaret's Hospital, Montgomery, of strangulated umbilical hernia.

John H. Samuel, Maysville Ky., Medical College of Ohio, Cincinnati, 1877, mayor of Maysville, 1920-1924, formerly member of the state board of health and president of board of education, aged 79, died, February 18, of pneumonia following an operation for intestinal obstruction.

Harry Blatt Harris, Orange, N. J., Columbia University College of Physicians and Surgeons, New York, 1906, member of the Medical Society of New Jersey, health officer of Orange, aged 50, died, February 12, in the Beth Israel Hospital, Newark, of uremia, nephritis and heart disease.

Horace Elwood Bragdon, Winthrop, Mass., Harvard University Medical School, Boston, 1891, member of the Massachusetts Medical Society, for twenty years on the staff of the Chelsea (Mass.) Memorial Hospital, aged 67, died, February 17, of coronary thrombosis.

Edmund A. Christian @ Pontiac, Mich., University of Michigan Department of Medicine and Surgery, Ann Arbor, 1882, member of the American Psychiatric Association, aged 77, medical superintendent of the Pontiac State Hospital, where he died, February 5, of heart disease.

Robert M. Kendrick, Selmer, Tenn., St. Louis College of Physicians and Surgeons, 1897, member of the Tennessee State Medical Association, formerly a druggist, for many years bank president and chairman of the school board, aged 64, died, February 20, of pneumonia.

John Hamilton Small, Montclair, N. J., Medico-Chirurgical College of Philadelphia, 1902, formerly assistant, adjunct and associate professor of bacteriology at his alma mater, aged 69, died, February 23, in the Memorial Hospital, Miami, Fla., of diabetes mellitus and carbuncle.

Oscar Suttle Justice, Central, Ala., Medical College of Alabama, Mobile, 1885, member of the Medical Association of the State of Alabama, formerly member of the state legislature, at one time county health officer, aged 74, died, February 10, of cerebral hemorrhage.

Horace Lee Simpson, Pensacola, Fla., College of Physicians and Surgeons, Medical Department of Columbia College, New York, 1886, member of the Florida Medical Association, on the staff of the Pensacola Hospital, aged 71, died, February 4, of cerebral hemorrhage.

Stephen Livingston Taylor @ Sherrill, N. Y., College of Physicians and Surgeons, Medical Department of Columbia College, New York, 1894, for many years health officer of Sherrill, aged 66, died, January 29, in the Faulkner Hospital, Boston, of heart disease.

William T. Short, Stonington, Ill., Marion-Sims College of Medicine, St. Louis, 1897, member of the Illinois State Medical Society, formerly district health superintendent of the state department of health, aged 62, died, February 10, of acute dilatation of the heart.

Frederick Jacob Korthals, Milwaukee, Marquette University School of Medicine, Milwaukee, 1914, member of the State Medical Society of Wisconsin, served during the World War, on the staff of St. Joseph's Hospital, aged 46, died, February 4, of colitis.

George Wallace Rawson, Amherst, Mass., Dartmouth Medical School, Hanover, N. H., 1888, member of the Massachusetts Medical Society, member of the school board, aged 73, died, Dec. 26, 1934, of carcinoma of the stomach, myocarditis and arteriosclerosis.

Earl Gates Heaton, Baldwinsville, N. Y., Hahnemann Medical College and Hospital of Philadelphia, 1896, bank president, formerly village president and member of the board of education, aged 60, died, February 7, of coronary occlusion and arteriosclerosis.

Alvah Arlington Fisher, Providence, R. I., University of the South Medical Department, Swanee, Tenn., 1895, member of the Rhode Island Medical Society, served during the World War, aged 63, died, February 15, in the Rhode Island Hospital, of leukemia.

Frank Eugene Guild @ Willimantic, Conn., Long Island College Hospital, Brooklyn, 1885, on the staff of the Windham Community Memorial Hospital, aged 81, died, February 3, in the Johns Hopkins Hospital, Baltimore, of infection of the urinary tract.

Francis Adams McClintock, Newcomb, Tenn., Tennessee Medical College, Knoxville, 1895, member of the Tennessee State Medical Association, secretary and past president of the Campbell County Medical Society, aged 73, died, February 18, of pneumonia.

Barney Ferrell, Bend, Ore., Northwestern University Medical School, Chicago, 1904, veteran of the Spanish-American War, on the staffs of the Lumbermen's and St. Charles hospitals, aged 59, died, January 15, of pulmonary tuberculosis.

Henry Holliday Stromberger, Los Angeles, Columbian University Medical Department, Washington, D. C., 1899, aged 68, died, February 1, in the Santa Monica (Calif.) Hospital, of a skull fracture received when he was struck by an automobile.

Lawrence Edward Zuley @ Oak Park, Ill., Loyola University School of Medicine, Chicago, 1932, on the staffs of the West Suburban Hospital and the Oak Park Hospital, aged 28, died, February 14, of appendicitis, general peritonitis and pneumonia.

De Witt Clinton Wilson, Los Angeles, Bellevue Hospital Medical College, New York, 1870, formerly member of the state legislature of Ohio, member of the city council and school board of Ironton, Ohio, aged 87, died, February 1, of cystitis.

Samuel Corley Ball, Fort Worth, Texas, Kentucky School of Medicine, Louisville, 1887, member of the State Medical Association of Texas, served during the World War, aged 69, died, January 23, in Texarkana, of hypertensive heart disease.

William Timothy Cannon, Brooklyn, Baltimore Medical College, 1901, formerly resident physician in the Brooklyn Home for Consumptives, aged 59, died, January 19, in the Swedish Hospital, of heart disease, following an operation.

George Hartnagel, Delphos, Ohio, Northwestern University Medical School, Chicago, 1910, member of the Ohio State Medical Association, served during the World War, aged 55, died, February 8, of acute coronary occlusion with infarct.

Walter S. Zorns, Taylor, Texas, Vanderbilt University School of Medicine, Nashville, Tenn., 1920, member of the State Medical Association of Texas, health officer of Taylor, aged 43, died, February 22, of acute lymphatic leukemia.

William Andrew Crooks @ Wahjamega, Mich., Hahnemann Medical College and Hospital, Chicago, 1899, formerly medical superintendent of the Michigan Farm Colony for Epileptics, aged 62, died, February 5, of carcinoma.

William David Tyrrell @ New York, Northwestern University Medical School, Chicago, 1899, on the staff of the Willard Parker Hospital, aged 64, died, February 26, when he fell from a nine story window of a hospital.

William Jennings Bauer, Indianapolis, State University of Iowa College of Medicine, Iowa City, 1933, aged 38, resident physician to the Methodist Episcopal Hospital, where he died, February 8, of subacute bacterial endocarditis.

Frank Scott Campbell, State College, Pa., Medico-Chirurgical College of Philadelphia, 1896, member of the Medical Society of the State of Pennsylvania, aged 66, died, February 12, of cardiovascular renal disease.

Augustus Orelne, New York, Julius-Maximilians-Universität Medizinische Fakultät, Würzburg, Bavaria, Germany, 1886, aged 72, died recently, in the Lenox Hill Hospital, of hypertrophy of the prostate and uremia.

Moses Gatlin Campbell, Atlanta, Ga., Atlanta Medical College, 1894, an Affiliate Fellow of the American Medical Association, on the staff of the Georgia Baptist Hospital, aged 73, died, February 8, of heart disease.

Millard Lafayette Stephens, Haleyville, Ala., Birmingham Medical College, 1909, member of the Medical Association of the State of Alabama, formerly mayor of Haleyville, aged 52, died, February 1, of pneumonia.

William M. Finley, Blountsville, Ala., Vanderbilt University School of Medicine, Nashville, Tenn., 1879, aged 77, died, January 24, in a hospital at Birmingham, of chronic myocarditis and hypertrophy of the prostate.

William E. Fisher, Portland, Conn., University of Pennsylvania Department of Medicine, Philadelphia, 1876, member of the Connecticut State Medical Society, aged 81, died, recently, of chronic myocarditis.

Samuel G. Miller, Chester, S. C., College of Physicians and Surgeons, Baltimore, 1879, member of the South Carolina Medical Association, aged 74, died, January 21, of arteriosclerosis and senile gangrene.

Antonino Scaturro @ New York, Regia Università di Napoli Facoltà di Medicina e Chirurgia, Italy, 1899, on the staff of the Columbus Hospital, aged 59, died, February 6, of a self-inflicted bullet wound.

Hugh Smith Rowlett, Maryville, Mo., Louisville (Ky.) Medical College, 1894, served during the World War, on the staff of St. Francis Hospital, aged 65, died, February 18, of arteriosclerosis and uremia.

Bernard Miller, Chicago, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1900, aged 58, died, February 13, of angina pectoris and chronic myocarditis.

Melvin William Lilly, Grandview, Iowa, State University of Iowa College of Medicine, Iowa City, 1872, formerly member of the board of health of Chicago, aged 84, died, February 6, of heart disease.

Marion A. McClelland @ Aguilar, Colo., St. Louis College of Physicians and Surgeons, 1926, served during the World War, aged 39, died, February 18, in St. Mary's Hospital, Pueblo, of pneumonia.

William H Clegg, Philadelphia University of Pennsylvania Department of Medicine Philadelphia, 1891 aged 69, died January 30, in the Philadelphia General Hospital, of carcinoma of the prostate

William S Aldridge, Lake Worth, Fla Western Reserve University Medical Department, Cleveland, 1892 formerly health officer and city physician, aged 68 died, February 9, of heart disease

Leslie James Lynch, Columbus, Ohio College of Physicians and Surgeons Keokuk Iowa 1879 also a druggist aged 86, died, February 13, at the Grant Hospital, of cerebral hemorrhage

Samuel A Poague, Clinton, Mo Marion Sims College of Medicine, St Louis, 1892, member of the Missouri State Medical Association, aged 69, died February 17, of senile dementia

Thomas Benton Selman, Silsbee, Texas Atlanta (Ga) Medical College 1890, member of the State Medical Association of Texas, aged 79, died, February 1, of pellagra and senile dementia

Willis S Michael, Junior W Va, College of Physicians and Surgeons Baltimore, 1893 member of the West Virginia State Medical Association, aged 63, died recently, of angina pectoris

Frederick Huber Brumm, Coldwater, Ohio Medical College of Ohio, Cincinnati, 1907, member of the Ohio State Medical Association, aged 50, died February 10, of heart disease

Rush Kersey Morton, Juniata Pines N J, College of Physicians and Surgeons Baltimore, 1900 veteran of the Spanish American War, aged 72, died, January 10, of heart disease

Jesse S Driver, Coolidge, Texa, Memphis (Tenn) Hospital Medical College, 1891 member of the State Medical Association of Texas, aged 68, died, January 18 of tuberculosis

Marie Burnadette Lucas, Washington, D C, Howard University College of Medicine Washington 1914 aged 60 died, February 23, of purpura haemorrhagica and pulmonary edema

Fred Bowers Taylor, Concord N H, Tufts College Medical School, Boston 1909, member of the New Hampshire Medical Society, aged 53, died, January 24 of cerebral hemorrhage

William L Bowers, Vada, Ga, Chattanooga (Tenn) Medical College, 1899, member of the Medical Association of Georgia, aged 68, died, February 8, of cerebral hemorrhage

Charles Fleet Scudder, Northport N Y, Cornell University Medical College, New York, 1911 served during the World War aged 49, died, February 3, of heart disease

William Beardsley Wilkinson, Staten Island N Y Bellevue Hospital Medical College, 1896 aged 66 died, February 2 in the Staten Island Hospital, of lobar pneumonia

Charles F Adams, Springfield Ohio, Medical College of Ohio, Cincinnati, 1884, member of the Ohio State Medical Association aged 73, died, February 15, of heart disease

Spurgeon Campbell, Winnipeg, Manit, Canada Manitoba Medical College, Winnipeg, 1904, served during the World War, aged 64 died, February 10, of coronary thrombosis

James N Downs, Atkinson, Ill, Homeopathic Hospital College, Cleveland, 1880, member of the Illinois State Medical Society, aged 80, died, February 3, of coronary occlusion

William Beringer Marcusson, Oak Park Ill, Rush Medical College, Chicago 1885, aged 74, died February 17, of cerebral arteriosclerosis, thrombosis and pneumonia

James T Gibson & Lynchburg, Ohio, Medical College of Ohio, Cincinnati 1897, member of the board of education, aged 66, died, February 14, of heart disease

John Inman Smith, London, Ky Hospital College of Medicine, Louisville, 1892, served during the World War aged 68, died, February 17, of heart disease

Oran D McCray, Marshall Mo, University Medical College of Kansas City, 1901 aged 58, died Dec 12, 1934, of carcinoma of the liver and diabetes mellitus

Frederick Tracy Fitch & East Hampton Conn Yale University School of Medicine, New Haven 1904 aged 57, died suddenly, February 16, of heart disease

Richard Henry Houghton, Boston Tufts College Medical School, Boston, 1905 aged 58, died February 8 in the Peter Bent Brigham Hospital of arteriosclerosis

William Henry Foster, St Louis, St Louis University School of Medicine, 1905 aged 59, died February 9, in the Missouri Baptist Sanitarium, of pneumonia

John Wilford Stiers, Detroit, Northwestern University Medical School Chicago, 1914, served during the World War, aged 45 died, February 10, of pneumonia

Harley Heath & Comstock, N Y, Albany Medical College 1909 chief physician to the Great Meadow Prison aged 54 died February 12 of heart disease

August Blass Lacour, Batchelor Ia Memphis (Tenn) Hospital Medical College, 1909, aged 53, died, February 2 of heart disease and cerebral hemorrhage

Marcus Warland Laney, Birmingham Ala, Vanderbilt University School of Medicine 1893, aged 71, died, February 5, of cerebral hemorrhage following a fall

Perry Edgar Mitchell, Wetumka, Okla, University of Nashville (Tenn) Medical Department, 1905, aged 54, died, February 16, of cerebral hemorrhage

Casper M Droste, Grand Rapids Mich College of Physicians and Surgeons of Chicago, 1885, aged 73, died, February 16 of heart disease, in St Louis

David M Bonham, Crawfordsville, Ind Eclectic Medical Institute, Cincinnati, 1875, aged 80, died, February 15 of carcinoma of the mouth and throat

William Clinton Seitz, Glen Rock Pa Hahnemann Medical College and Hospital of Philadelphia, 1888, aged 70 died February 4, of cerebral hemorrhage

Vincent Gialloreti, Chicago Regia Università di Napoli Facoltà di Medicina e Chirurgia, Italy, 1892, aged 69 died, March 6 of cerebral hemorrhage

William A Coldren, Uhrichsville, Ohio, University of Pennsylvania Department of Medicine, 1888, aged 75 died February 9 of diabetes mellitus

Sarah Alice Cohen May, New York Woman's Medical College of Pennsylvania Philadelphia 1879, aged 74, died Dec 10, 1934 of arteriosclerosis

Levi Willard Clough, Charlestown N H, University of Vermont College of Medicine, Burlington, 1887, aged 71, died, February 5, of arteriosclerosis

George Francis Goggins, De Pere, Wis Marquette University School of Medicine, Milwaukee, 1913, aged 49, died, February 16 of heart disease

Royal Woods, Omaha, Rush Medical College, Chicago 1889 served during the World War, aged 70 died, January 24 of carcinoma of the stomach

Joseph M Page, Dublin Ga University of Georgia Medical Department, Augusta, 1883, aged 74, died, Dec 14, 1934, of cerebral hemorrhage

Joseph B McClure, Norman, Okla Hospital College of Medicine, Louisville Ky, 1894, aged 72, died, in February, of coronary thrombosis

Walter Joseph Downs, Alfred Maine, Medical School of Maine, Portland, 1883 aged 79, died, Dec 14, 1934, of cerebral hemorrhage and pychitis

Ellis Corwin Cope & Barton Ohio, Ohio Medical University Columbus 1893 aged 65, died February 13, of erythema multiforme and uremia

Anson S Beckwith, London Ohio (licensed in Ohio in 1896) aged 70, died, February 20 in a hospital at Columbus of arteriosclerosis

Robert Wiener & New York, Eclectic Medical College of the City of New York, 1901, aged 58, died, January 1, of angina pectoris

Isabel Livingston, Needham, Mass, College of Physicians and Surgeons, Boston, 1903, aged 82, died, February 4, of carcinoma

Solomon Elswit, New York, Long Island College Hospital, Brooklyn, 1904, aged 52, died, Dec 27, 1934, of heart disease

Lee H Tully & Evansville Ind Louisville (Ky) Medical College 1890, aged 65, died February 21, of asthma and heart disease

H V Copenhaver, Rock Island Tenn (licensed in Tennessee in 1904) aged 72 died, January 29, of a malignant tumor

Homer M Calvin, Salineville, Ohio Columbus Medical College 1891 aged 67, died, February 3, of carcinoma of the liver

Robert M Funkhouser, Fairfield, Ill (licensed in Illinois in 1879) aged 84, died, February 1, of arteriosclerosis

Correspondence

PHOTOGRAPHS OF DR WILLIAM H WELCH

To the Editor—It is proposed to print an iconography of the best extant photographs of the late Dr William H Welch at different periods of his life, as a joint publication of the Institute of the History of Medicine and of the Welch Medical Library, Baltimore. A large number of such pictures have been assembled from his estate and otherwise, but there are undoubtedly various snap shots taken by various hands of which we have no knowledge. If copies of these can be mailed to the undersigned, it will be much appreciated by those interested in the matter and due acknowledgment will be given whenever such pictures can be used.

F H GARRISON, M D,
1900 East Monument Street,
Baltimore

Librarian, Welch Medical Library

DISTINGUISHING B COLI AND AEROGENES TYPES

To the Editor—Since Dr A M Crance believes it very important to distinguish between B coli and "aerogenes types" in treating cases of bacilluria (THE JOURNAL, January 26, p 285), I should like to point out an error in his method of differentiating these two species. Dr Crance states that "Aerogenes produces gas within forty-eight hours in saccharose, whereas Escherichia does not." Bacteriologists have long recognized saccharose and nonsaccharose fermenting strains of B coli and have termed them B coli-communior and B coli-communis, respectively. Thus Dr Crance's test does not distinguish B coli-communior from B aerogenes. The importance of this distinction becomes apparent when it is realized, as Jordan (ed 10, 1931) states that "nearly one half of the colon bacilli that are isolated from various sources produce gas in saccharose broth." It is surprising that Dr Crance does not use the well recognized methods for differentiating these two groups, such as the methyl red, Voges-Proskauer, uric acid or citrate tests. Regarding the rationale on which Dr Crance bases his "four-point treatment," it appears that the treatment contains several mutually counteracting procedures. The difficulty with which B acidophilus is established and maintained in the colon is well known and it therefore seems rather useless to try to implant this organism by feeding while at the same time the colon is being washed out daily with enemas (for the purpose of removing B coli but presumably not B acidophilus). It is also recognized that a diet containing milk and lactose is essential for implanting B acidophilus in the colon, yet Dr Crance's treatment consists of "two weeks of high protein diet, two weeks of high fat diet, and two weeks of high carbohydrate," and "the daily use of a good acidophilus preparation, preferably not in milk."

THOMAS C GRUBB, PH D, Brooklyn

[This letter was referred to Dr A M Crance, who replies.]

To the Editor—For clinical and practical reasons it is less confusing if such terminology as B communis and B communior is omitted. The former should be termed Escherichia coli. The latter, or the communior, is one of the saccharose fermenting strains and, clinically speaking, may be treated the same as B aerogenes. Two methods are applicable in distinguishing B aerogenes from B communior. The indole test is positive for the communior, negative for the aerogenes. The Voges-Proskauer test is positive for the aerogenes, negative in the case of the communior. Neither of these tests, however,

is necessary in distinguishing Escherichia coli from B aerogenes. On referring to the Bergey Manual of Bacteriological Classification, one will find some seven or eight varieties of aerogenes and twenty-two varieties of Escherichia. Certainly one cannot expect to subdivide the groups to any such extent as this. There will be much less confusion if the two major types of Escherichia coli and Aerobacter aerogenes remain as the outstanding ones so far as clinical treatment is concerned. These two organisms are decidedly different in their clinical management. Work is now being carried out in order to determine whether there is any difference in the effect of certain methods of therapy as applied to the aerogenes and the communior. For practical reasons it seems best, for the present at least, to treat these two types as one and the same organism, although it is definitely known that they differ somewhat bacteriologically.

Regarding the rationale of the "four-point treatment," experience has shown that the results have been satisfactory. The effect of acidophilus is perhaps accomplished before it reaches the colon, and certainly these organisms continue to pour into the colon from higher up in the intestinal tract, regardless of the daily enemas.

In answer to the necessity of milk with acidophilus, the very fact that it has been successfully marketed in solution of pure whey, remaining culturally active, should be sufficient evidence that its presence in milk is not essential to its existence.

A M CRANCE, M D, Geneva, N Y

TESTS OF SYMPATHETIC NERVOUS SYSTEM

To the Editor—I am interested in knowing how to diagnose paralysis of the sympathetic nervous system in which there is involvement of the peripheral structures, as the skin and blood vessels. How frequently are these structures affected in poliomyelitis? Please omit name.

M D, New York

Answer—The methods of diagnosing lesions of the sympathetic nervous system in which there is involvement of peripheral structures include such tests as the histamine test, nerve blocking test and Brown fever test.

These structures are frequently affected in anterior poliomyelitis.

Operations have been performed on the sympathetic nervous system by Royle and Hunter, Davis, Pollock, Adson, Wade, and Morton and Scott.

The term "sympathetic" was introduced by Winslow in 1732. The autonomic nervous system is regarded as the division of the nervous system that includes all the neurons lying outside the central nervous system and cerebral spinal ganglions except those associated with the special sense organs.

Owing to the fact that the sympathetic nervous system serves as a connecting link between the spinal cord and the internal organs, peripheral blood vessels, erector muscles of the hair and sweat glands, which connection is accomplished by means of the rami communicantes, various tests have been made to determine its physiology and its lesions.

In the Landis test the forearm of the patient is immersed in water at a temperature of from 43 to 45 C for thirty-five minutes, which produces vasodilatation in the lower extremities. If the surface temperature of the toes rises above 36.5 C, significant obliterative structural disease of the arteries of the lower extremities is definitely absent. If the surface temperature fails to rise to this level, organic arterial obstruction is probably present. These results correspond fairly accurately with the results observed after intravenous injection of typhoid vaccine used in spinal anesthesia and anesthetization of the posterior tibial nerve.

In the vasomotor index of Brown, fever is induced with intravenous typhoid vaccine and the increase of surface temperature of the limb is measured at half hour intervals with a thermocouple galvanometer.

In the histamine test, a small area of skin on the wrist, ankle or knee is cleansed with alcohol, which is allowed to dry. A drop of 1:1,000 solution of histamine phosphate is placed on it and introduced into the epidermis by multiple needle punctures in a manner similar to that used for cowpox vaccination. The excess histamine is gently removed. The characteristic response is thus described by Caldwell and Mayo: 1 A reddish purple spot appears as the result of local capillary dilatation. 2 A local wheal succeeds, because of transudation of serum from increased permeability of the capillaries. 3 A flare results as the effect of dilatation of the arteries by the reflex of a local reaction.

White suggested procaine block of the sympathetic nerve on the upper or lower extremities by paravertebral injection to the first and second thoracic sympathetic ganglions if the upper extremities are being tested. Following the successful block the rise in skin temperature is identical with the rise occurring after sympathetic ganglionectomy, as the temporary block creates conditions identical with those following the operation. It also imitates the effect of the operation in that pain of sympathetic origin will disappear and thus demonstrate what can be expected from the operation.

White, and especially Morton, advocate spinal anesthesia to determine whether there is a vascular spasm and occlusion of the lumen or whether a combination of the two exists. Spinal anesthesia blocks all motor sensory and sympathetic impulses and permits a maximal vascular dilatation. The vasomotor fibers to the blood vessels run in the peripheral nerves and are given off to the blood vessels segmentally. A block of the peripheral nerve should result in an increase in temperature of the innervated limb, because together with motor and sensory nerves the vasoconstrictors also will be paralyzed.

In describing the block of the brachial plexus, de Takats pointed out the hyperemia and rise in temperature of the arm that appears during a successful anesthesia.

The investigations of Royle and Hunter have opened up a relatively new field for surgical exploration. Some of the indications of sympathetic disturbances are Horner syndrome in the eye, circulatory disturbances of the extremities, arthritis, Hirschsprung's disease and spasticity of muscles.

According to Flothow it is on anatomic and functional knowledge that sympathetic surgery in the following lesions has been based: (1) Raynaud's disease, (2) thromboangiitis obliterans, (3) generalized scleroderma, (4) Hirschsprung's disease and chronic constipation, (5) spastic paraplegia, (6) chronic arthritis.

According to Craig, surgery of the sympathetic nervous system has proved of extreme value in relieving the symptoms in diseases that are associated with hyperactivity of the vasoconstrictor influence on the muscles producing cold, clammy extremities.

The majority of patients with Raynaud's disease are immediately relieved from their symptoms following this operation. Certain selected cases of thromboangiitis obliterans and chronic infectious arthritis are relieved in direct ratio in amount to the associated vasoconstriction present in the vessels of the extremities. Certain diseases of the colon and bladder are relieved also by interruption of the sympathetic nerve supply.

Diagnostic injection of the sympathetics may be used to determine the proper level for amputation when this operation is necessary, and the injection of alcohol will permit a low point of amputation and secure better healing of the stump.

Periarterial sympathetomy consists essentially in removing the adventitia with the nerve plexus contained in it from a segment of the vessel several centimeters in length.

Doppler proposed painting the femoral artery with a 7 per cent solution of phenol, thereby damaging the highly vulnerable fibers of the sympathetic nerves causing a marked vasodilatation. It is said to be simpler than the Leriche periarterial sympathetomy.

DERMATITIS HERPETIFORMIS

To the Editor—A boy aged 12 otherwise healthy and normal was stung or bitten by insects two years ago while the family was camping in the woods of Ontario. The insects appeared to be mosquitoes but the lesions have healed and recurred at intervals ever since. An intense itching and swelling results with a small central vesicle or pustule which is ruptured and serum exudes for a time and then heals for a while leaving very little evidence or mark to recur again. All the lesions are on the legs and arms. The parents took him to a physician who pronounced it the result of wood tick bites. His treatment however gave no relief and two or three crops have annoyed the patient for the past year.

W P LONG MD Weatherly Pa

ANSWER—An intensely itching recurrent vesicular and pustular eruption is most probably dermatitis herpetiformis. The wheals of urticaria rarely become vesicular, and a disease characterized by the recurrence of lesions that are consistently vesicular is not urticaria. While the distribution is not characteristic for dermatitis herpetiformis and nothing is said of grouped lesions, the disease in children is frequently atypical.

Whether the insect bites have any etiologic importance is a question. Dermatitis herpetiformis sometimes follows infection and in children frequently follows vaccination. The supposed insect bites may have been the first lesions of the disease.

A patch test made with a 50 per cent ointment of potassium iodide should bring out the eruption. Iodides given internally in full doses sometimes cause an exacerbation.

Arsenic internally usually as solution of potassium arsenite, in full dose usually clears up the eruption temporarily and abates the itching. Prescriptions should always bear the warning "not to be refilled," for the use of arsenic should always be under the control of the physician. Likewise roentgen rays in one-fourth erythema dose (75 roentgens) once a week may clear up the eruption, but they too may be harmful if carried beyond the sum of two erythema doses (600 roentgens) on any one area of the skin, no matter how long the interval is between doses.

The rules of hygiene, with regularity of sleep, exercise and food should be observed. Coffee, tea, cocoa, coca cola or anything conducive to nervousness should be avoided. Focal infections should be eradicated if found, and vaccines made from organisms isolated from these sources may be used. The stools should be examined for parasites.

Ultraviolet rays in a first degree erythema dose benefit some patients and when used over a long period may result in cure. Autogenous blood, from 5 to 10°C in a boy of 12 years, may be given intramuscularly every fifth day with great benefit in some cases.

Desiccated thyroid, iodides in small dosage, antipyrine, acetanilid, emetine in cases presenting pyrrhea, and salicin have all been credited with cures. Opening the vesicles may relieve the itching. Sulphur baths 60 Gm of sulphurated potash to the bath, or sulphur in ointment may give temporary relief.

PRURITUS OF SCROTUM

To the Editor—I have a patient with a subjective pruritus located on the scrotum which attacks with intense ferocity on one side or the other rarely on the two sides at the same time. He has received a great deal of treatment including x rays, radium, even extirpation of a certain itchy area and the eradication of a varicocele. A very careful study fails to reveal any pathologic lead on which one could go ahead with the exception that about ten years ago he had gonorrhea received treatment and made an apparently uneventful recovery. The Wassermann reaction is negative. Please omit name.

M D, Massachusetts

ANSWER—It is assumed from the description that the skin of the scrotum is normal. The case is therefore one of the fortunately rare ones of essential pruritus—a nervous ailment.

It is important that general and local hygienic measures be followed strictly. Coffee, tea, condiments, hot foods, alcohol and tobacco should be forbidden or at least limited as much as possible. Regularity of habits must be insisted on a generous amount of water ingested and whatever necessary done to insure adequate elimination by the bowels. Sleep must be secured if necessary by drugs—preferably bromides, chloral and cannabis, with care to avoid habit formation. Morphine and opium are to be avoided both because of the danger of habituation and because they are often harmful, actually increasing the itching.

The skin must be protected from the maceration of sweat by gentle washing with a sodium bicarbonate solution dabbed

dry and abundantly powdered. If necessary, flat gauze powder bags may be suspended between the scrotum and the thighs. If the skin is dry, soap should be avoided and cleansing done with oil. The habit of rubbing and scratching must be avoided, for this by itself can keep up the itching. Rough clothing must also be avoided.

A fragrant lotion containing phenol (not over 0.5 per cent), menthol and camphor or chloral hydrate may be helpful. Potassium permanganate solution 2 per cent may be painted on the skin daily, or silver nitrate solution up to 10 per cent, changing to a bland ointment when fissuring occurs.

C. G. Andrews (*Diseases of the Skin*, Philadelphia, W. B. Saunders Company, 1930, p. 367) speaks well of the results of alcohol injection into the skin. After surgical preparation, 95 per cent alcohol may be injected into the skin with a hypodermic syringe under general anesthesia. The needle is directed perpendicularly to the skin surface and 0.15 cc. (2 or 3 minims) of alcohol deposited just beneath the skin. These injections are spaced about 0.6 cm. (one-fourth inch) apart over the whole itchy area. No dressing is necessary. This does away with itching for six months or more when the pruritus may recur, usually less intensely. The treatment may then be repeated if necessary.

TOXEMIA DURING POLLEN THERAPY

To the Editor—During the past summer I administered a complete series of injections of pollen extract (ragweed and related genera) to a woman, aged 37 and her son, aged 10 years. The prophylaxis against hay fever was entirely satisfactory. However, both patients claim that they have been rendered exceedingly nervous as a result of these treatments. In the woman this is said to manifest itself as inability to concentrate, impairment of memory, and a tendency to shun the society of other people. There is also said to be a feeling of trembling throughout the body. In the boy there is said to be an inability to grasp his lessons at school or to advance in his study of the piano. In regard to the mother, there seems to be no evidence that she is going through the menopause. There has been no basal metabolism test to rule out hyperthyroidism, but such signs as rapid pulse, tremor of the hands and the various ocular symptoms cannot be elicited. The patient states that she is acquainted with several other persons who have been affected in a similar manner by these treatments. In these two patients there were no disagreeable reactions following any of the injections. Do you have any information at hand that would suggest whether or not there is any frequent effect on the nervous system following these injections? Kindly omit name. M. D., Ohio

ANSWER—Occasionally a form of toxemia may occur during the course of pollen therapy. The patient may complain of general lassitude, lack of appetite and loss of weight. The symptomatology described by the inquirer has never been seen in the course of the care of many hundreds of hay fever patients, nor does the literature contain any clear-cut examples of it. The occurrence of the same clinical picture in both the mother and child should make one highly suspicious of a psychoneurosis. The further fact that the patient claims that she knows of several other acquaintances who are similarly affected by pollen treatments should cause one to be even more than suspicious of her mental state.

This opinion takes into consideration the following possible exceptions. A disturbance of the nervous system may result in consequence of repeated and frequent systemic reactions. The use of ephedrine or ephedrine-like preparations along with the pollen therapy may result in symptoms as described. If these conditions do not prevail, the patients may be considered psychoneurotic and it may be well to cease treatment because of the unstable mental state and because of the possibility of development of an even greater variety of symptoms of psychogenic origin.

INTERMITTENT CLAUDICATION

To the Editor—Will you please tell me the most recent explanation for the cause of pain in the leg of a patient with intermittent claudication? Should carbohydrates be restricted in such a case? Has insulin been used with benefit? What treatment is most beneficial? What is the prognosis in a case with onset one year ago at the age of 61? The general health of this patient has been good in other respects. Please omit name and address. M. D., Ohio

ANSWER—If the patient has claudication, it is attributable solely to obstruction of the main arteries of the affected extremity. If the claudication is in the calf muscles, closure includes levels as high as the popliteal artery. The pain of claudication results from an insufficient amount of arterial blood reaching an actively exercising muscle. Relief is always obtained by rest, and a definite amount of exercise always will bring on the distress in the same situation. The symptom always means that there is an obstructive lesion in the major arteries of the affected extremity.

Dietetic treatment is of no avail. Insulin has no effect on claudication. The most efficacious treatment known at the present time is the use of tissue extracts. There are various types of tissue extract that prepared from the pancreas (insulin free), and that prepared from heart or skeletal muscle. They all contain some substance that apparently affects the metabolism of actively exercising muscle that is receiving a deficient supply of arterial blood. Pancreatic tissue extract, given by intramuscular injections of from 3 to 5 cc., usually increases the exercise tolerance several fold. Administration can be repeated at varying intervals depending on how long the beneficial effects last. Of equal importance, if the peripheral arteries are obstructed, is extreme care of the feet to avoid the development of ulcers or gangrene.

HEADACHES DURING MENSTRUATION

To the Editor—Is there any treatment to prevent headaches and nervous upsets associated with the menses when during two pregnancies the symptoms were entirely relieved? Please omit name.

M. D., California

ANSWER—In pregnant women, many changes occur throughout the course of gestation. Among these alterations are an increased production and excretion of estrogenic substance and gonad-stimulating principle. R. T. Frank has shown that in the great majority of normal nonpregnant women there is little follicular hormone in the circulating blood until the seventh day before the onset of the menstrual bleeding. At this time there is an abrupt rise in the amount of hormone but immediately after the onset of the menses a precipitous fall in the quantity of hormone regularly takes place. Hence, in the present case, it may be advisable to give estrogenic substance in the form of theelin, theelin Ammion or other product by mouth or hypodermically or both. The exact dose cannot be stated but one may begin by administering 50 or 100 rat units daily during the menstrual period or as long as the headaches last (larger doses are required by mouth). Preparations of anterior pituitary-like gonadotropic hormone such as Antutrin S or Follutein may be tried if estrogenic substance fails. Recently some patients with headaches of the migraine type have been relieved by the hypodermic use of ergotamine tartrate (Gynergen). Some cases of headaches apparently not migraine have also been helped by this preparation, others do not respond to it. Ergotamine tartrate does not ordinarily prevent headaches, but it may produce fairly rapid relief from cephalalgia. Other patients with migraine and migraine-like headaches have been considerably relieved by chondroitin sulphuric acid. This drug is best taken in capsule form and about nine capsules of 0.6 Gm. each are taken daily.

DANGERS OF DICHLOROBENZENE

To the Editor—Having noted in *Queries and Minor Notes* in *THE JOURNAL*, Oct. 13, 1934, page 1174, a question as to the dangers of benzene dichloride, I thought it might be of interest to relate a personal experience. A patient of mine, a woman in her twenties, who was exceptionally strong, healthy, and athletic spent almost an entire day packing away winter clothing and furs with the crystals of Dichloride. That night she slept in the same room as was the closet in which she had stored the clothes. The door did not close tightly, and hence the fumes from the Dichloride freely entered the room. In the morning there was noted marked swelling of the hands, feet and ankles. The young woman did not feel ill but was aghast to find that she had gained 6 pounds since the previous morning. This great increase of weight was evidently due to a retention of fluids. The urine was quite normal. She played golf on that and the following days and at the end of about three days the swelling had disappeared and the weight returned to normal. There seems no reason to doubt that the retention of fluids was due to the inhalation of the Dichloride fumes. It seems likely that this was due to some effect on the walls of the small blood vessels causing an unusual transudation of serum into the tissues. There appeared in *THE JOURNAL*, Feb. 10, 1934, page 461, an editorial entitled "Benzene as a Cardiac and Vasomotor Poison" which may throw some light on this case. I should be glad if you would give me your opinion on this subject. THOMAS A. CLAYTOR, M.D., Washington, D. C.

ANSWER—We have been unable to find any record in the literature of poisoning from paradichlorobenzene, although one case was recently reported of intoxication from monochlorobenzene. As the introduction of chlorine into the benzene molecule is said not materially to modify the toxicity of the substance, it is conceivable that poisoning could arise from paradichlorobenzene under special conditions. As was pointed out in the query and minor note in question the possibility of intoxication by this compound is ordinarily limited by the fact that it is a solid at ordinary temperatures, nevertheless the fumes must be active by reason of the fact that the vapors alone act as an insecticide. For this reason the edema reported by Dr. Claytor may well have been caused by this substance, though this is by no means certain.

RESIDUAL EFFECTS OF CARBON MONOXIDE POISONING

To the Editor—I would appreciate some information with regard to the residual effects from carbon monoxide poisoning. Is it possible after an individual has apparently recovered from a single poisoning from this gas to be left with a damaged condition of the lungs and blood and to drag along for a couple of months showing very few symptoms? What is the usual length of time that it takes for the pneumonia that may result from such poisoning to manifest itself? Also what is the longest interval that may elapse between exposure and incidence of pneumonia? Is it necessary in order to have a condition of chronic carbon monoxide poisoning for one to come repeatedly in slight contact with the gas day after day or can a condition of chronicity result from one severe exposure to the gas? Any references on acute and chronic carbon monoxide poisoning will be appreciated. Please omit name.

M D Louisiana

ANSWER.—In the large majority of cases of carbon monoxide poisoning if the patient does not die in the gas, consciousness returns in, at most, a few hours and recovery from the ill effects of the gassing is complete within a few days. It is only after an exposure of many hours to a sublethal concentration of carbon monoxide that injuries to the nervous system and mentality, and occasionally to other organs and functions, develop and persist throughout the remainder of life. If pneumonia does not develop within a week, its subsequent development cannot well be charged to due to asphyxia. Chronic carbon monoxide poisoning can occur only under conditions of frequent exposure, and not from one severe exposure other than the residual effects referred to. Further information regarding acute poisoning is given by Yundell Henderson in an article entitled 'The Dangers of Carbon Monoxide Poisoning and Measures to Lessen These Dangers' THE JOURNAL, Jan. 18, 1930 page 179 and 'Resuscitation' THE JOURNAL, Sept. 8, 1934 page 750 and September 15 page 834. Information on the more obscure subject of chronic poisoning is given by Dr. Alice Hamilton in 'Industrial Toxicology' New York, Harper and Brothers, 1934.

HEPATIC CIRRHOSIS

To the Editor—Are injections of liver extract in any way beneficial in treating hepatic cirrhosis (atrophic or alcoholic)? I should also appreciate information as to any new remedy or surgical treatment that would help in such a case of cirrhosis.

GLYNERO LOMBARDI M D Brooklyn

ANSWER.—Injections of liver extract are of value when an anemia is present possibly owing to the absence of the intrinsic substance in such a cirrhosis.

In some cases the ascites may be relieved and held in abeyance by medical treatment. The patient should receive daily doses of one of the acid base salts, as ammonium nitrate, 2 Gm. four times a day, and be given an injection of one of the mercurial diuretics every third day until the ascitic fluid has disappeared when the mercurial diuretic may be discontinued but the acid base salts continued. At the first reappearance of the fluid the mercurial diuretic should be resumed.

The Talma-Morrison operation has given the best results. The percentage of cures is not available in any large series of cases. The operation consists in drawing large masses of the omentum into pockets made between the peritoneum and the anterior abdominal wall. The omentum may be rubbed or abraded, but this is not considered essential. The diaphragmatic surface of the liver may be rubbed with gauze and the same action carried out on the under surface of the diaphragm, if the patient is in good condition after the omentum has been placed in the peritoneal pouches. However, in some cases the abrasion of the upper surface of the liver and the lower surface of the diaphragm has caused serious shock. About one patient out of six will be fairly well for a number of years.

EXTRASISTOLES

To the Editor—I am troubled much with extrasystoles. The condition is worse when I go to bed and often interferes with my falling asleep. Occasionally I am awakened with a severe attack usually toward morning. I am also troubled with severe hyperacidity of a nervous character, as no evidence of ulcer has been found. The size of the heart is normal compensation for my age (51) is good. A cardiogram shows nothing abnormal. What treatment would you suggest for the troublesome extrasystoles? Please omit name.

M D New York

ANSWER.—Extrasystoles in the absence of any other evidence of heart disease are unimportant except as they may cause troublesome sensations. Sir James Mackenzie's advice was, first, reassurance about the significance of extrasystoles in such cases; second, the omission of any toxic or irritating factor such as tobacco, indigestion or fatigue; third, exercise in the open air, and, finally, if necessary, the use of some sedative,

particularly bromides. Authoritative cardiovascular opinions at the present time agree with this old advice of Mackenzie with the additional suggestion of trying quinine sulphate from 0.13 to 0.2 Gm. (2 to 3 grains) three or four times a day particularly at bedtime, when extrasystoles are more prone to occur or to be noticed.

Hence it is well to correct factors such as the overuse of tobacco, tea, coffee, heavy meals at night, long fatiguing hours and lack of exercise. If these measures do not suffice, a trial of bromides is advisable. 0.5 Gm. (7½ grains) three or four times a day or of quinine sulphate in the dosage mentioned, or of the two together for a week or two or three at a time as needed. If this additional measure does not suffice, the extrasystoles should be ignored so far as possible. One becomes accustomed to them in time and may not notice them at all eventually.

There is a relationship to hyperacidity in some patients. Digestive disturbances frequently act reflexly on the heart.

ABSORPTION BY RECTUM

To the Editor—I am interested in the new theories as to absorption of dextrose, saline, saline solution, coffee and so on when given by rectum. Could you send me literature concerning this or advise me where to find that information?

MALCOLM D. HARRISON M D Washington D C

ANSWER.—The following references might be of value to the inquirer.

NO RELATIONSHIP BETWEEN ALUMINUM IN DIET AND FURUNCULOSIS

To the Editor—I am writing in regard to aluminum poisoning in relation to furunculosis. I have under my care at the present time a family of seven children and the father and mother with multiple furuncles. The history begins three years ago when they purchased a heavy aluminum cooking set. At this time the entire family had never had any skin eruption or furuncles. Six months after the aluminum set had been purchased two of the pots began to pit on the bottom. Six months after the pitting was noted the smallest child in the family, 7 years of age, began to have boils in the gluteal region. One by one the entire family has had furuncles in the gluteal region and neck. One boy aged 18 years was in the hospital with multiple furuncles on the lateral surface of his left leg from the knee to the ankle. The lesion did not penetrate beyond the fascia. The leg was treated with hot packs, and after draining two months and general supportive treatment the wound cleared up. The boy seemed to have no resistance to this low grade staphylococcal infection. I might mention that the family lives in a large house and has a married son living in the same house but cooking and eating separately. He and his wife and two children did not have furuncles although they were constantly together except for their meals. I should like to know whether there is any relationship between furunculosis and aluminum poisoning. Of course it is realized that aluminum should not pit.

CARL B. COLE M D Vancouver Wash

ANSWER.—So far as known, aluminum in the tissues exists only in minute quantities and has at the maximum amount no deleterious effect when the phosphorus content of the diet is normal (Schwartz, E. W., Cox, G. J., Unangst, R. B., Murphy, F. J., and Wigman, Helen B. The Extent of the Retention of Ingested Aluminum, THE JOURNAL, Nov. 25, 1933, p. 1722). The boils are due to some other factor common to the members of this family. It may be a fault in diet, poor choice of foods, bad cooking, contamination of food by some poison, the use of 'patent medicines,' or an infection to which the other family is not exposed.

ALLERGIC RHINORRHEA

To the Editor—I have a patient, aged 14 years, who has suffered from asthma for many years. Skin tests have been positive for foods and many other substances, all of which have been eliminated and at present the chest shows no sign of asthma. The patient now sneezes a great deal alternately with periods of "stuffed nose." Examination of the nose shows enlargement of the left inferior turbinate. Do you feel that cauterization will relieve or cure the nasal condition? What possible ill effects can cauterization have on the original asthmatic condition? Please omit name.

M D, New York

ANSWER—From the history as given, the attacks of sneezing and the periods of stuffed nose would lead one to make a diagnosis of vasomotor or allergic rhinorrhea. This diagnosis would be further substantiated if the mucosa of the nose has the characteristic waterlogged appearance seen in this condition, and if the secretions are thin and watery rather than thick and purulent.

Cauterization of a turbinate, such as described, will for varying periods and in a number of instances improve the airway. It frequently fails to do so. Cauterization in itself cannot cure the nasal condition, which rests, in all likelihood, on a sensitivity similar to the one that caused the asthma. It is hardly likely that the asthmatic condition will be made worse by the cauterization. In fact, from time to time, and for no apparent good reason, minor nasal interventions have been known to have a beneficial effect on asthma.

NEUROCIRCULATORY ASTHENIA

To the Editor—A man aged 42, has consulted me with complaints that are apparently due to neurocirculatory asthenia and nonspecific bronchitis. He attributes his subnormal health for more than fifteen years to being gassed with phosgene in the Argonne. He continued on active duty at the front until after the armistice a month later. Will you tell me what the probabilities are that a brief exposure to phosgene gas in October 1918 could have had such lasting effects? Particularly could it have caused the symptoms of cardiac neurons? Please omit name.

M D, Georgia

ANSWER—There is not even a possibility that the symptoms are due to any organic effects of the phosgene gas. The gas or other war experiences may have constituted sufficient psychic trauma. The possibility of some mild infection causing enough physical trauma must be considered but, with a history of fifteen years, is most improbable. But underlying all such cases is the "constitutional inferiority" of McFee Campbell, and in the more extreme cases little if any activating factor is needed.

The bronchitis should be closely investigated and the results checked by roentgen examination if this has not been done.

LABORATORY DIAGNOSIS OF GLYCOSURIA

To the Editor—What is the most practical and efficient means of treating cases of diabetes mellitus with a high renal threshold while in the hospital, and later when discharged to the outpatient clinic? At the present time two ward patients have renal thresholds of 295 and 310 mg per hundred cubic centimeters. The daily check with urinalysis is almost useless for these tests are sugar free almost up to the onset of coma, and blood sugars every other day or so produce a secondary anemia as shown by a case treated here in the recent past. Please omit name and address.

M D, Pennsylvania

ANSWER—When the renal threshold for sugar in diabetes mellitus is as high as described in these cases, the treatment must of course be controlled by reference to the blood sugar level rather than to the glycosuria. Aside from the presence of the ketone bodies in the urine, which represents too great a disturbance in the metabolism to be clinically useful as the sole guide to proper treatment, there is no other laboratory criterion of the diabetic state that does not involve blood sampling.

There seems to be no reason to believe that the secondary anemia observed in the patient from whom blood samples were taken every other day was anything more than a coincidence. However, this contingency may be entirely avoided by employing one of the several micromethods for blood sugar estimation that are available.

EFFECTS OF BENZINE ON PLEURA

To the Editor—Will you please be kind enough to write me at your earliest convenience what action benzine would have on the pleura of the lungs as to adhesions and the like.

PAUL W. JOHNSON, M D, Winston-Salem, N C

ANSWER—It is presumed that the question refers to the introduction of benzene directly into the pleura. If such is the query, then benzene probably as a local irritant would produce adhesions. Its use, however, for this purpose should

not be encouraged, because benzene introduced in this way would be highly toxic and cause profound disturbance of the nervous system. It is also well known that benzene has direct toxic effect on both lymphoid and myeloid tissues. There is, however, the question of the action of benzene on the inhalation of the volatile substance. Such action might irritate the bronchi and alveoli cause cellular reactions that lead secondarily to pleural involvement. It is probable that such action might occur by benzene lowering the resistance of the tissues and causing secondary infection.

AUTONOMIC EPILEPSY (?)

To the Editor—A white school girl, aged 14, has insomnia, also nervous twitching or tremor of the hands and feet, preceded the day before attacks of vertigo. These attacks have come on every five to six weeks for the last five years. Birth was normal. She has had measles, mumps and whooping cough. The tonsils and adenoids were removed seven years ago. Her mental condition is good. Otherwise the history is negative. Menstruation is not established. She weighs 86 pounds (39 Kg), height is 59 inches (150 cm) and she is poorly nourished. The heart, eyes, ears, nose and throat are normal. There is no enlargement of the thyroid. The heart lungs and abdomen are normal. The blood pressure is normal and the blood Wassermann and spinal fluid Wassermann reactions are negative. Hemoglobin is 75, red blood cells number 3,700,000, white blood cells, 7,400. The urine is normal. When seen during an attack of so-called nervousness the child would sit up in bed, fully conscious, with some tremors of the upper and lower extremities, the pulse rising to 130 per minute. This was of short duration—about five minutes. Please give diagnosis and suggest treatment. Please omit name.

M D, Maine

ANSWER—The attacks described are not characteristic of epilepsy. Because of their recurrence in the same form they suggest some sort of periodic discharge corresponding in nature with migraine or with an autonomic variety of epilepsy. Careful neurologic examination, with special reference to the autonomic centers in the brain, is indicated. If this gives negative results a search for sources of allergic reaction should be made. Until these studies are made, therapeutic efforts can be directed only toward an improvement in the general state of nutrition.

READING DIFFICULTY AND OPHTHALMIC EXAMINATIONS

To the Editor—In the type of work in which I am engaged (child guidance clinic), I frequently have children referred to me who have some reading difficulty. The question of proper eye examination comes up particularly as it is related to the etiologic factors in the reading difficulty. More than an ordinary eye examination is required. I would much appreciate it if you would outline what would be considered an adequate examination in view of the most recent developments, and the chief factors to be taken into consideration in remedial work. Please omit name.

M D, Rhode Island

ANSWER—The first examination is of course a careful refraction under cycloplegia, preferably atropine. Possible heterotropia should then be ruled out, by the cover test. Heterophoria in a child is more difficult to determine until a mentality of at least 8 or 9 years has been reached. Binocular vision and fusion should be examined for with the amblyoscope and any of the standard stereoscopic charts. Predominance of one of the other eyes can be determined by the same methods. Mirror writing is of course self evident. The examination of the central visual field areas is possible in some children but only a few, particularly when searching for a paracentral scotoma and when determining the size of the blind spot. With the knowledge given by these suggested examinations, any possible ocular factor in reading difficulty can be eliminated.

ZINC PREPARATIONS IN GONORRHEA—TRICHLOROETHYLENE IN NEURALGIA

To the Editor—1. Is zinc permanganate used in about the same percentage as zinc sulphate solution for urethral injection for gonorrhea? 2. Also, would you recommend the inhalation of trichloroethylene for facial neuralgia?

EDWIN O. SWANSON, M D, St Paul

ANSWER—1. Zinc permanganate is a vigorous oxidizing agent. The strength of its solutions to be used for urethral injection must be patterned more after that of potassium permanganate than that of zinc. A strength of 1:2,000 might be considered average, with a range of from 1:1,000 to 1:4,000. Zinc permanganate is not official and it does not stand accepted by the Council on Pharmacy and Chemistry.

2. Trichloroethylene inhalation is worth trying in cases of facial neuralgia. It will give relief in some cases and fail completely in others.

Medical Examinations and Licensure

COMING EXAMINATIONS

AMERICAN BOARD OF DERMATOLOGY AND SYPHILOLOGY *Written (Group B candidates)* The examination will be held in various cities throughout the country April 29 *Oral (Group A and Group B candidates)* New York June 10 Sec Dr C Guy Lane, 416 Marlborough St, Boston

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY *Final oral and clinical examination (Group A and Group B candidates)* Atlantic City N J June 10-11 Sec, Dr Paul Titus, 1015 Highland Bldg Pittsburgh

AMERICAN BOARD OF OPHTHALMOLOGY Philadelphia June 8, and New York, June 10 *Applications must be filed before April 10* Sec Dr William H Wilder 122 S Michigan Blvd Chicago

Book Notices

Synopsis of Pediatrics By John Zahorsky A.B. M.D. F.A.C.P. Professor of Pediatrics and Director of the Department of Pediatrics St. Louis University Medical School. Assisted by T. S. Zahorsky B.S. M.D. Assistant in Pediatrics St. Louis University Medical School. Cloth Price \$4. Pp. 359 with 83 illustrations. St. Louis: C. V. Mosby Company, 1934.

This is a compact, pocket sized volume, which has condensed modern pediatric knowledge into sixty chapters. It is suitable for the classroom teaching of the subject to the medical student and should be useful to the practitioner as a handy guide in general practice. The subject matter is carefully treated and, though condensed, the essential points in symptomatology, diagnosis and treatment are well covered. Theoretical discussion, when included, is brief and to the point, and diseases that concern more particularly other specialties have received short but adequate consideration. The volume well fills the gap that exists between the larger textbooks, with fuller theoretical discussions and references to the literature of pediatrics, and the small mimeographed manuals in use at some of the medical schools. It also allows the practitioner the chance to obtain a competent guide in a small volume. The senior author of this synopsis has long been a master in the teaching and practice of pediatrics. His experience has enabled him to condense the material so that there is no loss in value due to brevity, as is the case in many another synopsis. The book is well printed and the illustrations are excellent. It should find favor with medical students and practitioners alike because of its well arranged and condensed subject matter. It is probably within the range of the purse of the medical student so that ownership should not be prohibitive.

Suprarrenales y metabolismo de los hidratos de carbono Por Luis F. Leloir. Tesis de doctorado en medicina. Padrino de tesis: Prof. Dr. Bernardo A. Houssay. Universidad Nacional de Buenos Aires. Facultad de Ciencias Médicas. Paper. Pp. 188. Buenos Aires: Imp. A. Balocco y Cia. 1934.

Numerous experiments have been performed to throw additional light on the relationship of the adrenal glands to carbohydrate metabolism. From the data obtained, these experiments indicate that excision of the adrenals causes a diminution in blood sugar. Extirpation of the adrenal medulla or denervation of both adrenals does not result in any appreciable alterations in blood sugar. Excision of the adrenal glands produces a great decrease in liver glycogen, occasionally causing it to disappear completely. Muscle glycogen is also lessened and the intravenous injection of dextrose results in still greater diminution in contradistinction to the increase that is seen in normal animals. Injection of adrenal cortex extract restores the blood sugar to normal. It is believed that there is an antagonistic action between epinephrine and insulin and that denervation and extirpation of the adrenal medulla increase the animal's sensitivity to insulin, but that complete excision of the adrenal causes a still greater sensitivity to insulin.

The Physical and Mental Growth of Prematurely Born Children By Julius H. Hess M.D. Professor of Pediatrics, College of Medicine, University of Illinois. Chicago. George J. Mohr M.D. Director, Pittsburgh Child Guidance Center and Phyllis F. Bartelme Ph.D. Psychologist, Cook County Juvenile Court, Chicago. Cloth. Price \$5. Pp. 449 with 80 illustrations. Chicago: University of Chicago Press, 1934.

The authors are well known for their current contributions on the subject of prematurely born children. This book probably contains more original research and statistical data than any other book on the subject. The senior author is well known for his previous authoritative book on premature infants, published some years ago for the physician. In this book, however, are correlated physical and mental development, with the result that it is perhaps unique of its kind. The question of what type of physical and mental progress the prematurely born infant makes is admirably answered. Several chapters on related medical aspects of premature children are contributed by other well qualified authors. The organization of the book is excellent, considering the amount of data utilized. There are numerous valuable tables and graphs which enable the reader to crystallize the descriptive material. The value of the book will be readily apparent to those charged with the medical care

of prematurely born children. It, however, will serve with almost equal value those interested in psychology and child welfare. The book is a distinct contribution to the literature on medical and social science and should be the property of every medical library.

"Ererbte Taubheit" Grundzüge zur Erkennung erblicher Hörstörungen sowie die das Gesetz zur Verhütung erbkranken Nachwuchses betreffen. Von Prof. Dr. M. Schwarz, Oberarzt der Universitäts Hals-, Nasen- und Ohrenklinik Tübingen. Paper. Price 4 marks. Pp. 56 with 23 illustrations. Leipzig: Georg Thieme, 1935.

This monograph includes a discussion of the laws of heredity and the incidence of dominant and recessive factors under a variety of combinations as well as a study of the various types of deafness in relationship to heredity. The forms of deafness considered are recessive as well as sporadic deafmutism, hereditary-degenerative inner ear deafness, endemic or deafness of cretinism, otosclerosis, and deafness, complete or partial, the result of chronic inflammatory processes of the middle ear in which a lessened resistance of the mucosa is the recurring factor. Each of these types is discussed rather fully as to incidence, mode of hereditary transmission, presence of other physical characteristics, diagnosis, method of examination and sociological implications. In line with the policy of the German state concerning defectives, the author recommends sterilization in all but the strictly middle ear types of deafness.

The 1934 Year Book of Radiology Diagnosis Edited by Charles A. Waters M.D. Associate in Roentgenology, Johns Hopkins University. Therapeutics. Edited by Ira I. Kaplan B.Sc. M.D. Director, Division of Cancer, Department of Hospitals, City of New York. Cloth. Price \$4.50. Pp. 512, with 434 illustrations. Chicago: Year Book Publishers, Inc. 1934.

As customary, this issue is divided into a diagnostic section and a section dealing with therapy. The literature has been well reviewed and condensed, with occasional footnotes expressing the author's point of view, which is valuable. Both authors apologize for the scarcity of original material, which is due to the economic condition. This attitude is a reflection of their modesty, because much of the material is quite valuable, as it represents variations in technique, amplification of many unusual conditions, and a reiteration of known experiences. Disease processes know no formulas, and it is just as important to become familiar with simulants, variants and heterotopic forms as to become acquainted with the classic forms and methods, which, after all, are infrequent. It can well be said that, should future editions be as informative as those of the past, a perpetual endorsement can be assured.

Kompendium der topischen Gehirn- und Rückenmarksdiagnostik Kurzgefasste Anleitung zur klinischen Lokalisation der Erkrankungen und Verletzungen der Nervenzentren. Von Robert Bing, ordentlicher Professor an der Universität Basel. Ninth edition. Paper. Price 9 marks. Pp. 227 with 127 illustrations. Berlin & Vienna: Urban & Schwarzenberg, 1934.

Twenty-five years has passed since Professor Bing published his first compend on diagnosis of brain and spinal cord diseases. In the present edition he has written a modern, excellent and detailed text despite the fact that the book is only a compend. Bing divides the subject matter into two parts: (a) the topical diagnosis of spinal cord disorders, (b) topical diagnosis of brain disorders. The topical diagnosis of spinal cord disorders takes up in detail the topographical anatomy of the spinal cord in regard to the diagnosis of lesions involving the various pathways that is, motor, sensory, trophic, vasomotor and pilomotor, both as separate and combined lesions. It further considers the anatomic and physiologic foundations for localization of the level of any lesion, central, radicular or peripheral. The topical diagnosis of brain disorders deals with the basic fundamentals of structure and the localization of lesions of the brain stem, cerebellum, brain, basal ganglia and hypophysis. Encephalography and ventriculography are discussed in relation to their indications and interpretations. The book is clearly written and contains an unusual amount of current anatomic and physiologic thought. His method of presenting the material of neurologic diagnosis is practical and easy to assimilate. This compend contains all that is needed for the student to get a thorough understanding and rationalization in the interpretation of neurologic signs and symptoms. It may be highly recommended.

The Cyclopedia of Medicine George Morris Herschel B.S. M.D. Editor in Chief and Edward L. Bortz A.B. M.D. Assistant Editor. Chief Associate Editors: W. Wayne Balcock A.M. M.D. Conrad Berens M.D. P. Brooke Bland M.D. Francis L. Lederer B.S. M.D. and A. (Craemo) Mitchell M.D. Volume XII TEN ZONA Fahrholdt Price \$120 per set of 12 volumes and index Pp 1004 with illustrations Philadelphia F. A. Davis Company 1934

This volume begins with the tendons, and after discussing such leading topics as tetanus, thermic injuries, the thorax, thrombosis, the thyroid and thymus, tobacco and the tongue tremors and tuberculosis, it goes on to tumors, typhoid meningitis, urology, urticaria, the uterus, the veins and the vitamins the vulva and vagina, and those limited medical topics which come under x, y and z. It is well up to the standard maintained by the previous volumes. Such leading authors as J. D. Barney, Victor Bonney, Lawrison Brown, Leo Buerger, George Crile, Allen K. Kruse, Matas, Musser, Pemberton and Webb are included among the contributors. The book is exceedingly well illustrated and is printed two columns to the page in easily readable type. Each topic is fully outlined and much extraneous matter has been eliminated. The work is thereby made most practical. It will appeal especially to the general practitioner who wants a ready reference work with emphasis on treatment.

Handbook of Filterable Viruses By R. W. Fairbrother M.D. M.R.C.P., Lecturer in Bacteriology and Assistant Director of the Public Health Laboratory Manchester University. Cloth Price 7/6 Pp 183 London William Heinemann Ltd 1934

The first half of this small volume consists of a summary of the nature, methods of study and classification of viruses and the epidemiology and immunity of virus diseases. Current opinions are concisely expressed and controversial matters are reduced to a minimum. The author takes the view that viruses are biologic units. The second half of the book contains short descriptions of certain diseases of man and lower animals grouped according to whether they are "accepted," "probable" or "possible" virus diseases. Experimental studies are summarized in each case. The author has condensed much information into a few pages and is to be commended for the result. The style is direct and the book is easily read. A list of references is given with each section in some instances the choice of reference does not seem judicious. The experimental work in this field has proved exceptionally fruitful in recent years and a better acquaintance with the advances made is readily obtainable by the perusal of this handbook. For this reason it is useful to the acquiring student and inquiring physician.

Who Shall Survive? A New Approach to the Problem of Human Interrelations By J. L. Moreno M.D. Nervous and Mental Disease Monograph Series No. 38. Cloth Price \$4 Pp 437 with illustrations Washington D. C. Nervous & Mental Disease Publishing Company 1934

This highly technical work is an attempt to analyze the emotional relationships of human beings in the business and the social world, based on the feelings of human beings toward one another. The method of study is unusual. On the basis of this type of study the author attempts to analyze such racial difficulties as have developed in Germany, and to outline a plan for new types of social organization. In the series of supplements the author provides a study of children's reactions to one another in schools and of workers' reactions to one another in shops.

L'hypertréphyose, Cancérisation et cicatrization Par le Docteur Pierre Lemay docteur de l'Université. Paper Price 20 francs Pp 160 Paris Librairie E. Le François 1934

This work deals with the author's hypothesis based on the experimental research of Carrel concerning trephones. The author's conclusions, which he admits are only theoretical do not agree with conclusions drawn by Carrel. According to the author there are two antagonistic substances that control the life and proliferations of the cell the trephones which stimulate and antagonistic substances, which inhibit. In young individuals the trephones predominate, in older individuals the antagonistic substances predominate. A disturbance in the balance of these substances, which results in overactivity of the trephones causes (1) growth and general development of the embryo, (2) cicatrization and (3) cancerization. When the antagonistic substances predominate, the result is aging, death,

and cessation of cicatrization. According to this conception, general growth is looked on as hypertrephocytosis, aging as hypotrephocytosis, and cicatrization as localized momentary hypertrephocytosis. Cancerization is localized and uncontrolled hypertrephocytosis. Since in older persons the balance is in favor of inhibitory substances, tumor growth is slower than in young persons. The author believes that the action of the trephones is related to the activity of ferments. In support of his hypothesis he quotes a collection of his publications on this subject for the last ten years.

How in Practice Medicine By Henry W. Kemp M.D. Cloth Price \$2.50 Pp 156 New York Paul B. Hoeber Inc 1935

In this book a practitioner advises young men how to set themselves up in practice. He also offers practical information concerning their relationships to other practitioners, the etiquette of making calls, and their relationships to nurses, women and children. He discusses the care of the child, and obstetrics in general practice, and concludes with many simple hints on various phases of medical work. There is some advice for the aged and some prescriptions are presented which the author has apparently found useful in his work. Unfortunately, in these prescriptions he violates many of the best rules regarding prescription writing and uses for his vehicles some compounds that are essentially "shotgun" prescriptions in themselves. The exceedingly young man who is naive may find a few hints in this work that will be most valuable to him in his beginning of medical practice.

The Constitution and its Reaction in Health By T. E. Hammond F.R.C.S. Assistant Surgeon The Royal Infirmary Cardiff. Cloth Price 7/6 1p 160 London H. K. Lewis & Company Ltd, 1934

The rather difficult title of this book does not express its contents. The book is essentially a textbook of personal hygiene. The author begins with six chapters on the constitution of man and his reactions to the seasons, to the weather and to nature generally. He classifies human bodies as hyposthenic and hypersthenic from the constitutional point of view. He then discusses all the common aspects of living in relationship to the human body, illustrating his discussions with brief notes of interesting cases. While much that is presented in this book is useful, it will strike the average American medical reader as most elementary and hardly on a par with some works available in this country.

The Advance of Science Edited by Watson Davis Director Science Service Washington D. C. Cloth Price \$3.50 1p 400 with illustrations Garden City N. Y. Doubleday Doran & Company Inc 1934

This volume attempts to summarize knowledge in many scientific fields and to present it in a manner understandable to the average well educated reader. The considerations include not only chemistry and physics but also geography, physiology, pathology, biology, eugenics and many other related topics. For the reader who wants a cursory survey of experimentation and of the newer discoveries, the volume should prove attractive. For the special reader it is far too diffuse to be significant. It is a most useful text, however, in indicating the manner in which Science Service makes modern science understandable.

Chemioterapia del cancro Dal Prof. G. Flichera. Paper Price 25 lire Pp 213 with 20 illustrations Milan Ulrico Hoepli 1935

This is the author's report on the chemotherapy of cancer to the international congress in Madrid in 1933. The report gives a long review of the literature on the subject, with an extensive bibliography. An index would have been helpful. Many kinds of treatment have been tried without success and no form of chemotherapy of cancer is beyond the experimental stage.

Manual of Clinical Laboratory Methods By Pauline S. Dimmitt Ph.G. Medical Technologist for the Stout Clinic Sherman Texas. Cloth Price \$2 Pp 150 with 36 illustrations Philadelphia F. A. Davis Company 1934

This small volume concerns itself primarily with the details of clinical laboratory procedures. The data are presented in almost outline form and cover the usual list of subjects found in books of clinical laboratory methods. Outside of its simplicity, the book has little to recommend it to the practicing physician. For the student it lacks the detail necessary for the development of a rational understanding of laboratory methods or their clinical application.

Medicolegal

Contract to Perform Vasectomy Not Against Public Policy—The plaintiff's wife had experienced great difficulty with the birth of her first child and had been advised that it would be dangerous to her life to bear another. The defendant-physician was consulted by the plaintiff and advised that a vasectomy be performed on the plaintiff. The operation was performed, and, it was alleged, the defendant-physician pronounced it successful and guaranteed the sterility of the husband. Notwithstanding the operation, however, the plaintiff's wife again became pregnant. The wife survived the birth of the baby but the plaintiff sued the defendant-physician to recover damages for the great anxiety the pregnancy had caused him and for the expenses incurred in connection therewith. The trial court sustained a demurrer to the complaint on the ground that the contract and performance of the operation were against public policy and that the law would leave the parties where they placed themselves. The plaintiff thereupon appealed to the Supreme Court of Minnesota.

The plaintiff in this case based his cause of action solely on the failure of the operation to fulfil the defendant's alleged promise. The complaint did not charge lack of skill, malpractice, or negligence in any respect in the performance of the operation. The first question presented, said the Supreme Court of Minnesota, is whether a contract to perform such an operation under the circumstances here presented is against public policy and for that reason void. No authorities bearing directly on this question were cited by either party to the suit and the court itself could find none. There is in Minnesota, said the court, no statutory prohibition against sterilization. The plaintiff was married and presumably would remain married to his present wife, who had been competently advised of the danger of further pregnancy. The operation of sterilization on a man is a simple one, said the court, accompanied by very slight hazards, whereas that on a woman is more serious and requires a greater degree of skill on the part of the physician. It entails hospitalization. It is frequently performed on women who habitually miscarry or abort. So far as progeny is concerned, the results to this married couple would be the same were effective sterilization performed on either. Therefore, in the opinion of the court, it was entirely justifiable for them to take the simpler and less dangerous alternative and have the husband sterilized. Such an operation does not impair, but frequently improves, the health and vigor of the patient. Except for his inability to beget children, he is in every respect as capable physically and mentally as before. It does not render the patient impotent or unable "to fight for the king," as was the case in mayhem or maiming. The court concluded that under the circumstances the contract was not void as against public policy nor was the performance of the operation illegal on that account.

The plaintiff contended, however, that his complaint was grounded on deceit, and relied on the case of *Hedin v Minneapolis M & S Institute*, 62 Minn 146, 64 N W 158, 35 L. R. A. 417, 54 Am. St. Rep. 628. But, said the Supreme Court, there was no allegation of fraudulent intent on the defendant's part or any of the elements of deceit. In such an action the plaintiff must allege and prove, not only that the representation was false, but also that it was made with fraudulent intent. In the *Hedin* case there was abundant evidence to support the jury in finding that the defendant-physician must have known that his promise of cure could not be performed. The plaintiff in the present action did not seek to recover for breach of contract, he alleged no malpractice. He admitted that the operation he contracted for was performed. It is a matter of common knowledge that such an operation properly done in due course effects sterilization. It is in common use in states which authorize sterilization of defectives. Any competent physician or surgeon must necessarily have given the plaintiff advice to that effect. The purpose of the operation was to save the wife from the hazards to her life which were incident to childbirth. It was not the alleged purpose to save the expense incident to pregnancy and delivery. The wife

survived. Instead of losing his wife, the plaintiff has been blessed with the fatherhood of another child. The expenses alleged are incident to the bearing of a child, and their avoidance is remote from the avowed purpose of the operation. As well might the plaintiff charge the defendant with the cost of education of the child. Although the validity of the contract was upheld, the judgment sustaining defendant's demurrer was affirmed. The action of the trial court, sustaining a demurrer to the complaint, was affirmed.—*Christiansen v Thornby* (Minn.), 255 N W 620.

Current Medical Literature

AMERICAN

The Association library lends periodicals to Fellows of the Association and to individual subscribers to THE JOURNAL in continental United States and Canada for a period of three days. Periodicals are available from 1925 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 12 cents if two periodicals are requested). Periodicals published by the American Medical Association are not available for lending but may be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Cardiovascular Response to Injection of Epinephrine and Solution of Pituitary—Elliot and Nuzum measured the blood pressure and pulse rate at intervals of five minutes over a period of one hour in thirty-two patients having essential hypertension, who had received a subcutaneous injection of 1 mg of epinephrine. The average systolic pressure fell slightly over a period of thirty-five minutes and then returned to the preinjection level, the average diastolic pressure fell to a maximal low point at forty-five minutes and remained near that level throughout the remainder of the period. The average pulse pressure decreased. The average pulse rate rose. A degree of parallelism existed between changes in the systolic pressure and in the pulse rate of these patients, such that a rise in pressure was usually accompanied by a rise in pulse rate and a fall in systolic pressure by either a lowered or an unchanged pulse. Elevation of systolic pressure may be primarily the result of cardiac stimulation by epinephrine whereas the fall in diastolic pressure is attributable to arteriolar dilatation. In forty hypertensive patients studied in a similar manner after receiving a subcutaneous injection of solution of pituitary, a slight rise in the average diastolic pressure and an equally slight fall in the average systolic pressure were observed after twenty minutes. The average pulse rate was unchanged. In the same patient, an unusual response to the injection of solution of pituitary was not necessarily accompanied by a vigorous response to epinephrine. No constant or frequent deviation from the reported normal cardiovascular response to the subcutaneous injection of epinephrine and solution of pituitary could be demonstrated in this series of patients having essential hypertension.

Paradoxical Embolism—Hirschboeck states that about 50 per cent of the instances of paradoxical embolism are associated with antecedent pulmonary embolism. A study of the intra auricular blood pressure establishes the pressure as somewhat higher in the left auricle than in the right assuring competence as far as any circulation of blood from the right auricle to the left auricle is concerned in a state of health. An anatomic patency is therefore associated with a physiologic com-

petence. Any disturbance in the pressure relationship may favor the development of paradoxical emboli when thrombosis in the venous circulation is present. Haggart and Walker showed experimentally that a sudden occlusion of the left pulmonary artery caused an immediate rise in the pulmonary pressure of about 29 per cent, whereas with total pulmonary occlusion the pressure increased rapidly from 120 to 257 per cent with an immediate fall in the systemic arterial pressure. A patent foramen ovale is the most common of all fetal relics. The literature generally recognizes this in all necropsies as between 30 and 35 per cent. Diagnostically, paradoxical embolism may be assumed as occurring in life if the patient is the subject of venous thrombosis, develops an embolus in the systemic circulation and, after a careful search, has no other apparent causes for arterial embolism. If pulmonary infarction precedes the embolic accident, the diagnosis is more certain. The author reports a case that illustrates the sequence of paradoxical emboli in the systemic circulation subsequent to venous thrombosis and in association with antecedent pulmonary embolism. It represents one of the rare instances in which an embolus is found in transit through the patent foramen ovale at the time of death.

Pathologic Physiology of Neuroglandular System—Crile emphasizes that the brain and the sympathetic nervous system and the glands are indissolubly linked together in function that the one component of the neuroglandular system that can be normally and pathologically conditioned is nerve tissue—that is, the brain and sympathetic nervous system, that the glands cannot be so conditioned, that the brain and the sympathetic system can be conditioned only with the collaboration of certain hormones, and that in the case of civilized man the rise especially of the thyroid has so facilitated the conditioning of the brain that man owes his distinctions and his diseases to this unique collaboration. In support of this conception the author offers the clinical results of the application of this principle in 350 cases of hyperkinetic diseases improved by dekineticizing procedures.

*Gastric Digestion Simple Visual Test and In Vitro Studies M B Levin and S Raffel, Baltimore —p 865

Macrocytic Anemia in Banti's Disease—Wright reports a case of Banti's disease in which the blood count showed a definite change from a hypochromic microcytic type of anemia to a macrocytic type closely resembling pernicious anemia in the stage of remission. He studied a series of cases diagnosed as Banti's disease to show that a color index of more than 1 is much more frequent and the mean color index higher in the groups with evidence of portal cirrhosis than in those without this complication. It is a well substantiated fact that a macrocytic type of anemia frequently occurs in portal cirrhosis. From his case report and from the study of the cases of Banti's disease it is obvious to the author that a macrocytic (pernicious) type of blood picture will appear when portal cirrhosis develops. Therefore the concept that Banti's disease is always accompanied by a microcytic type of anemia is erroneous.

Remissions in Hyperthyroidism Induced by Pregnancy Urine Extract—Starr and Patton treated thirteen cases of hyperthyroidism with pregnancy urine extract and the clinical The

usual course of treatment lasted for four or five months. Remission of hyperthyroidism has occurred coincidental with the treatment in seven cases. The six failures seem to illustrate that the induction of remission by pregnancy urine extract is dependent on normal ovarian function. At the present time no physiologic proof that the remission occurring in these cases may be attributed to the pregnancy urine extract and theelin treatment can be given, because the mechanism of such an action is unknown. Nevertheless, remissions have occurred abruptly in the healthiest adolescent girl, and more gradually in adult women. In two cases the return of menstruation, which had ceased during pregnancy urine extract treatment, was coincident with remission, as evidenced by a gain of weight, previously stationary, and a reduction of the metabolic rate to or nearly to the normal zone.

Gastric Digestion—Levin and Raffel found a microscopic method of estimation of gastric digestion based on the demonstrated ability of the gastric secretions to digest striae, connective tissue and nuclei to furnish a satisfactory index of gastric function (digestion). The mixture of secretions derived from the duodenum when combined with pepsin hydrochloric acid promotes the rapidity of digestion to a marked degree. Such increased activity occurs if the components are allowed to act on the test material at an appropriately low pH. Under these conditions, neutralization of the acid after a short period inhibits the progress of the digestion only to some degree. When neutralization of the mixture is effected before it has come into contact with the test material, however, no digestive activity is manifested. On the basis of these observations it is suggested that large doses of alkali be administered both before and after meals in cases of duodenal ulcer. Simultaneous experiments on the comparative digestibilities *in vivo* and *in vitro* of various animal proteins in the form of representative meats have indicated that a dried beef-liver preparation is of value in cases in which such proteins are desired but cannot be conveniently taken in the usual manner.

Intracranial Operations in Sitting Position—Gardner recommends the sitting position of the patient combined with tribrom-ethanol anesthesia for operations on the cerebellum. This position results in (1) a diminution in bleeding, (2) a lowering of intracranial pressure, (3) a lessened tendency to immediate cerebral edema and (4) an improved respiratory exchange, and it also facilitates access to the patient, particularly by the anesthetist. This position is not recommended for operations on tumors about the sella turcica or on the inferior surfaces of the cerebral hemispheres. In other cerebral tumors the position is recommended with reservation, because of the tendency for an occasional patient to go into prompt and profound shock. The position has distinct advantages in cervical and upper dorsal laminectomy and in excision of the cervico-dorsal sympathetic ganglions by the Adson approach. It does not predispose to postoperative hemorrhage.

Meningioma as Cause of Epilepsy—In reviewing 291 cases of meningioma, Groff observed that the incidence of epilepsy in this series was 30.9 per cent, or ninety cases. In these ninety cases there were eighteen of severe seven of mild and sixty-five of jacksonian seizures. The latter group was divided into thirty-six cases of a motor type of attack, twenty-two of a sensory motor spell and seven of a pure sensory seizure. Aside from these ninety cases there were twelve of uncinat fits. In fourteen of the eighteen cases of generalized convulsions the lesions were in the frontal lobe or the temporal lobe or arising from the sphenoid ridge. In fifty-four of the sixty-five cases of jacksonian epilepsy the tumors involved the frontal and parietal lobes. Ten of the twelve cases of uncinat fits presented tumors in close relationship to the uncinat gyrus. The incidence of epileptic seizure was greatest in tumors of the frontal, parietal and temporal lobe. There were 116 patients with tumors in this region and eighty had convulsions. All except sixteen of these had focal attacks. In the twenty-one cases of tumor located in the posterior fossa, not one was complicated by convulsive seizures. Sixty-six patients had pre-operative convulsions. Twenty-four were relieved after the tumor was removed in an average follow-up period of four years. Thirteen of the 201 patients without convulsions developed seizures after operation. Eight of these had jacksonian seizures, while the remaining five had severe attacks.

Effect of Superior Laryngeal Nerves on Tracheal Mucus—It is apparent to Johnson that 1 Stimulation of the peripheral ends of the recurrent and of the superior laryngeal nerves will cause a secretion of tracheal mucus. 2 A more abundant secretion is produced by pilocarpine. 3 Stimulation of the central end of the vagus or of the superior laryngeal nerves will cause a reflex secretion of mucus. 4 Direct stimulation of the tracheal mucosa will cause a secretion of mucus partially by direct irritation of the mucous glands and partially by stimulation of the mucous glands through a reflex arc. 5 These secretory mechanisms may be interrupted by atropine, except that of direct irritation of the mucous glands. 6 The demonstration of these facts together with the clinical observation presents fairly good presumptive evidence that there is a definite relationship between injury to the superior laryngeal nerves during thyroidectomy and the formation of postoperative tracheal mucus.

Peritoneum in Repair of Inguinal Hernia—Levering studied the tensile strength of various fasciae in dogs and compared these observations with similar studies made on the tensile strength of the peritoneum of the same animals. It seemed possible that some structure readily available in certain types of hernia might prove satisfactory for use in the reinforcement.

ment of the abdominal wall. He found that the peritoneum has sufficient tensile strength so that it may be utilized in the repair of certain inguinal hernias. The experiments further show that peritoneum will unite with fascia and, when it comes in contact with the perimetrium of muscle, will unite with it in a similar manner as does the fascial suture. The author suggests that the hernial sac which now is discarded, be used in operations in which indications exist for reinforcement of the abdominal wall.

Selective Thoracoplasty in Treatment of Tuberculosis.—Overholt emphasizes that thoracoplasty should be so planned that maximal collapse of the involved lung and minimal collapse of the healthy portions of the lung is the result. The portion of the thoracic cage to be resected should not only include that part of the thoracic wall over areas of cavitation but should extend sufficiently to relax fibrotic uncavitated lung. The collapse obtained in the area treated should be complete within itself with each stage. In order to accomplish this long or complete rib and transverse process resections should be carried out, beginning at the top of the thoracic cage. The length of time between stages should be long enough to allow an accurate estimation of the necessity for, and the extent of, a second rib resection. This period should also be of sufficient length to permit the patient to receive the maximal benefit from the first operation before the second one is attempted. The operation can be offered to patients with a relatively small amount of involvement of the upper portion of one lung because the base on the same side is conserved. The operation can be offered to patients with bilateral disease who have good lower lobes and who otherwise would have no hope for recovery. Of 120 operations on seventy-three patients, the operative mortality was 25 per cent and the patient mortality 41 per cent.

Histologic Observations on Fundus Oculi in Leukemia.—From their study of eleven eyes in cases of leukemia it appears to Goldstein and Wexler that in most instances the retinal lesions are minimal, since they do not produce profound disturbance in the retinal structure and the retinal vessels are normal in appearance. Such changes as marked sheathing of the veins, together with exudation of large numbers of leukocytes into the retina and nerve, are decidedly the exception. Also, fragmentation and necrosis of the walls of the larger vessels must be unusual. Similarly, in the choroid, while dilatation of the sinuses with leukocytes to a variable degree is the rule, the enormous infiltration with enlargement noted in one of the cases is exceptional. Destruction of the wall of the blood vessel following infiltration was noted. The fragments of the wall of the vessel were necrotic, and the only explanation is invasion or local proliferation of blood cells. Of unusual interest was the sheathing of the posterior ciliary vessels and the infiltration of large numbers of leukocytes into the episclera, both in association with the infiltration into the choroid. In this case exophthalmos and edema of the conjunctiva of the left eye had occurred more or less coincidentally with a marked increase in the white blood cell count. While the orbital tissues were not examined and orbital lymphoma therefore was not demonstrated, it is fair to assume, from the condition of the episclera, that such a lesion existed and was responsible for the edema and the exophthalmos. While it is possible that

the sudden increase in the number of white blood cells was a factor in its etiology, the microscopic appearances do not warrant a definite statement as to whether the extra-ocular infiltration came by way of the choroid or directly from the blood stream.

Senile Osteomalacia.—Kleinberg cites a case of atrophy of bone in which the atrophy was limited to the spinal column and pelvis, the etiology was obscure, the softening of the vertebral bodies resulted in a painful posterior curvature of the spine and rest on a convex frame yielded complete relief. Clinical examination revealed no neurologic disturbances in the cerebrospinal system that could induce atrophy of bone. Disuse was dismissed because despite the pain the patient was able to get about considerably, walking and working every day. Thus it was concluded that the disease of the spine was nutritional or metabolic. The demineralization progressed to such a degree that it caused a partial collapse of certain of the dorsal vertebrae, with resultant pain and deformity. The nutritional upset may be considered a senescent degenerative change. Why the metabolic upheaval should appear and involve a limited portion of the skeleton is inexplicable. In addition to rest on the canvas convex frame the patient received sedative doses of baking and massage of the back several times a day. Within three weeks the pain and tenderness disappeared, the kyphosis was reduced, and the patient, with the support of a light plaster-of-paris jacket, was able to move about comfortably and was discharged.

Preoperative Irradiation of Massive Tumors of Kidney.—In the experience of Wharton, preoperative irradiation of both Wilms and Grawitz tumors causes a remarkable decrease in their size and makes them easily operable. Preoperative irradiation also causes definite cellular changes in the malignant tissue such as hyalinization, pyknosis, fragmentation and destruction of the architecture of the tumor. Irradiation, however, will not destroy malignant tumors entirely. After having been intensively irradiated, tumors that he has removed have uniformly shown living malignant tissue, those that he has not removed have resumed active growth. Roentgen therapy is only a means of preparation to make the tumor operable, or a palliative measure to hold in check a tumor that cannot be removed. He believes that the transperitoneal approach is the most logical, clean and surest way to remove tumors of the kidney.

Irradiation in Treatment of Tumors of the Hypophysis—Rand and Taylor studied twenty-three cases to estimate the value of high voltage radiation in the treatment of tumors of the hypophysis. There were five cases of chromophil adenoma, thirteen chromophobe adenomas, two adenocarcinomas and three cystic chromophobe adenomas. Chromophil adenomas react most favorably to this form of treatment. The permanence of relief is indefinite. Eosinophilic and basophilic cells seem to react most favorably to irradiation. Chromophobe adenomas have not responded uniformly. Tumors of the hypophysis may be mixed. The predominating cells may be of the chromophobe type, but there may be a smattering of other types of cells. Adenocarcinoma of the hypophysis apparently does not react favorably to high voltage irradiation. Cystic adenomas of the chromophobe variety show no improvement following irradiation. When apparent chromophobe tumors fail to react favorably to irradiation within a short time, they are likely cystic and more amenable to surgical treatment. Irradiation can be given more intensively if a decompression is provided first. Apparently certain patients suffering from pituitary tumors gain from moderate to useful vision following irradiation. Without irradiation they would almost certainly become blind. No definite regression has been seen in general acromegalic symptoms following irradiation nor any definite advance in symptoms. Postoperatively, patients without irradiation have maintained improved vision on an average of from one to three years. It would seem logical in selected cases to employ irradiation first, in the hope that certain patients may be helped enough thereby to render surgical intervention unnecessary. These patients should be under the close scrutiny of a neurologic surgeon, for, at best, high voltage irradiation will give satisfactory results in only a certain proportion of cases. It does not replace the surgical procedure but rather acts as an adjunct to it.

Detection of Lead in Peripheral Blood—Blumberg and Scott describe a thirty minute spectrographic micromethod for the detection of pathologic amounts of lead in 0.1 cc samples of peripheral blood. The instrument used was a Hilger E1 large quartz spectrograph, operated in conjunction with a graphite arc and a quartz spherocylindric concentrating lens. The electrodes employed were high purity graphite rods, 10 mm in diameter. The upper electrode, the negative, was used with a flat surface. The lower electrode, the positive, was hollowed at its upper end by means of a steel drill, leaving an evenly cored space approximately 6.5 mm in diameter and

3 mm in depth. For each analysis three samples of blood from the finger were obtained, preferably from different fingers. The samples were collected in 0.1 cc micro blood sugar pipets. The blood from each finger was delivered immediately into the hollow core of a prepared electrode, which was then replaced in the inverted test tube and taken for analysis. By means of careful drainage, the pipets were emptied so well that the amount of blood left adhering to their walls was of no practical significance. With the blood in the core of the lower positive electrode, and with the flat upper electrode as the negative pole, the arc was struck. For about fifteen seconds the electrodes were scarcely separated, thus permitting the clotted blood to smolder and partly to char, without actually burning. The electrodes were then drawn apart and the arc allowed to burn. By visual observation of the light beam and of the burning electrodes, it was easy to tell when the sample had completely burned. This usually required from thirty to forty-five seconds. After the photographic plate was developed and fixed, it was rinsed in water and examined. If the blood contained a pathologic amount of lead, the sensitive lead line at 2,833.07 angstrom units would appear visible to the eye, and the minor lines at 2,802.09 angstrom units and 2,614.20 angstrom units could be seen with the aid of a lens. This was considered a positive result. In the control samples the sensitive line at 2,833.07 angstrom units either did not appear or showed as a faint line visible only with the aid of a lens. The minor lines could not be detected at all. This was considered a negative result. The authors originally intended the method for peripheral blood samples, but it can be used also with uncoagulated venous blood. In the case of the latter, care must be taken to use an anticoagulant free from lead. In their experience it has appeared that, unless a preliminary drying of the measured sample is resorted to, the uncoagulated venous blood is more difficult to burn than the quickly clotting peripheral sample.

Status Asthmaticus A T Sterling, Philadelphia—p 189

Effect of Low Humidity on Pollen Asthma—From a study of the results of twenty-two patients, sixteen of whom were completely relieved in four days, Rappaport and his associates conclude that the rapidity with which pollen asthmatic patients are relieved is greater under conditions of low humidity and relatively constant temperature in a pollen-free atmosphere than when the temperature and humidity are not controlled. In a pollen-free atmosphere, with the relative humidity ranging between 15 and 40 per cent and the temperatures ranging between 72 and 82 F, patients with pollen asthma had a delayed onset (from six to eight hours) of symptoms in attacks precipitated by storms. This conclusion is based on a comparison with the time of onset (one hour) of symptoms in the patients of an experimental ward in 1932. It is the authors' impression that the asthmatic attacks in the ward during storms were less severe and that the symptoms disappeared much more rapidly as compared to attacks precipitated during the experimental period of 1932. Under their experimental conditions, a concentration of ozone considerably greater than occurs after a heavy electrical storm showed no beneficial or detrimental effects. Some other factor, or factors, outside of pollen, humidity, temperature, or the concentration of ozone must play a part in the precipitation of symptoms of asthma in pollen asthmatic persons. Barometric changes and ionization have not been studied.

Technic on Intracutaneous Tests—Rackemann and Simon emphasize the importance of chemical as well as bacteriologic

cleanliness in making intracutaneous tests. The need for all-glass syringes is defined, and a convenient rack for segregating and labeling the syringes is described. When this improved technique is applied to the study of normal, nonallergic individuals, many positive skin tests are obtained. The importance of this observation to the study of allergic patients is discussed.

Creatinine Clearance During Hyperthermia.—Grant and Medes studied the creatinine clearances in dogs during the hyperthermia produced by diathermy and creatinine clearances in patients with fever caused by infection in order to determine the effect of general systemic hyperthermia on creatinine clearance and the extent to which any changes observed in infectious fevers may be referred to the elevation of body temperature. In contrast to the general parallelism that exists between body temperature and creatinine clearance in dogs during diathermy when all other factors are being held as nearly constant as possible, the creatinine clearances in patients with fever undergo wide variations. In the series of fifteen patients observed, the clearances during the height of the fever varied from 600 to 60 per cent of their postfebrile values. A survey of the relationship between blood pressure and filtration during the fever revealed similar irregularities. Nine patients showed an elevation of all three factors, temperature, blood pressure and filtration, three showed an increase in blood pressure with a fall in filtration, and in one patient filtration and blood pressure were lowered, while in the remaining two cases the changes in blood pressure and filtration were insignificant. The group whose behavior is the most difficult to explain on a theoretical basis is that in which blood pressure and temperature were both elevated while filtration was lowered. Two other known factors may be considered as responsible for this behavior: (1) There may be a decrease in the volume flow of blood to the kidney in spite of an elevation of temperature and blood pressure, and (2) there may be a direct effect of the infection on the kidney, resulting in a temporary closing off of some of the glomeruli or in an altering of their permeability.

Response to Infection in Bone Marrow Dyscrasias.—Bethell hopes that, by observing the degree of bone marrow response as measured by the total neutrophil count, the effort of the response as indicated by the percentage of immature forms and the severity of the infection as interpreted by the percentage of basophilic granule cells, some information may be gained concerning the physiology of the bone marrow in certain pathologic states. He observed that the response of the bone marrow to infection is dependent on its pre-existing func-

tional state as well as on the nature and severity of the infectious process. The estimation of the number of neutrophils in the circulating blood and their classification into nonfilament and filament nuclear forms does not differentiate between the intrinsic and extrinsic factors involved in the response. The occurrence of basophilic granules in the cytoplasm of the neutrophils is, on the other hand, solely a result of the infection. The total neutrophil count may be regarded as a measure of the degree of the bone marrow response, the percentage of nonfilament or immature forms as an indication of the effort of the response and the percentage of neutrophils exhibiting basophilic granulation as a sign of the severity of the infection. By correlation of these data, obtained from successive blood examinations of the same subject, it is possible to ascertain the nature of the bone marrow response as well as the progress of the infection. The author presents six cases of infection in the presence of various types of bone marrow dyscrasia which illustrate the manner in which this correlation is carried out. In these cases the percentage of neutrophils exhibiting cytoplasmic basophilic granulation gives a more accurate indication of the severity and the progress of the infection than either the total number of neutrophils per cubic millimeter or their degree of immaturity. Of the four fatal cases presented, pathologic diagnoses were available in three, and, so far as the methods of examination permitted, the conclusions arrived at by the blood studies were confirmed.

Elliptic Human Erythrocytes.—Stephens and Tatelbaum discuss the hematologic studies of fifteen members of an Italian family, eight of whom exhibited elliptic erythrocytes. In each of the affected persons there was an increase in the number of red blood cells per cubic millimeter, with a definite decrease in the mean corpuscular volume and the mean corpuscular hemoglobin. The number of red blood cells was inversely proportional to the mean cell volume and hemoglobin content. Two dimensional measurements of cells in fixed, stained smears indicated that the decrease in size involved the round cells and the abnormally shaped cells to approximately the same extent, without increase in the variability of distribution of cell size. In the unaffected members of the family the erythrocytes were normal in shape, size, volume and hemoglobin content.

Determination of Blood Cholesterol.—Andes states that, in the colorimetric estimation of blood (or serum) cholesterol, plaster of paris seems to be the most satisfactory desiccating medium and chloroform appears to be the most suitable extracting medium. He describes a method for the determination of cholesterol in blood (or other body fluids). The blood is dried on plaster of paris and the cholesterol is extracted with chloroform, the entire extraction and color development being completed in a Folin-Wu sugar tube.

Blood-Filled Cysts on Cardiac Valves in Infancy.—Mills states that the routine postmortem examinations of seventy-two hearts of new-born infants and children during a period of six months disclosed the rather frequent occurrence

of small, blood-filled elevations on the auricular surfaces of the atrioventricular valves. Twenty-three, or 32 per cent, disclosed the presence of blood-filled cysts on the cardiac valves. The majority of the subjects were full-term infants who had either been stillborn or had died within the first week of life. The oldest child of the group with cysts on the cardiac valves was 8 months of age, the youngest, a premature infant in the seventh month of gestation. Although the largest number of cysts (fourteen) occurred in the case of this premature infant, none were found in a group of five hearts from fetuses 6 months old or less when the cardiac valves were studied microscopically in serial section. The causes of death in the entire series were principally trauma at birth, congenital malformations or infection among older children. The site of predilection for these nodules is the atrioventricular valves, with the tricuspid valves slightly the favorite. The presence of a blood-filled cyst also was noted on a papillary muscle in one case. These cysts usually are found from 1 to 3 mm removed from the free edges of the valve on its auricular surface, although they may occur anywhere on the surface of the leaflets. It is usual for these cysts to be multiple, and occasionally they may be grouped so closely that the surface of the valve resembles a raspberry. Cysts on the semilunar valves project on the ventricular aspect of the valve near the base of the cusp. The cysts vary in size from that of a pinpoint to 2 mm in diameter. They may be multilocular, and this is particularly apparent when they are seen microscopically. Grossly, they appear as dark, sharply circumscribed, rounded elevations on the smooth surface of the valve. They are easily visible in a good light with the naked eye because of the contrast of the dark contents of the cyst against the pale background of the surface of the valve. The cyst usually is a round, smooth-walled cavity, pushing up the endothelium of the surface of the valve beneath which it lies. The wall is composed of a few concentric layers of fibrous connective tissue, and the lining of the cyst is made up of a single layer of spindle shaped cells with long, oval nuclei that cannot be distinguished from endothelium. The cysts may be multilocular or a series of communicating cavities. If the pressure within them becomes too great, the partitions may rupture, thereby converting a group of cysts into one large cavity. Small outpouchings from the periphery of the wall of the cyst, generally on the ventricular side, may be seen. In addition, several small, oval or elongated spaces are seen, which apparently are lined with endothelium, lying within the substance of the valve and running in a direction at right angles to the long axis of the leaflet. The contents of the cysts are chiefly erythrocytes, with occasional leukocytes and cells desquamated from the inner wall of the cavity. The explanations that have been offered by Elsasser, Bertu, Nichols, and Haushalter and Thury for the origin of these cysts are discussed and the present theory is given that they are cystic dilatations at the ends of endothelial-lined canals in the substance of the valves.

Sodium Thiocyanate in Treatment of Bacillary Dysentery.—Mitchell and Goldman observed that sodium thiocyanate in the dosage of one-third gram (0.02 Gm.) per kilogram of body weight orally seems to have definite prophylactic value in Shiga dysentery and also if given intravenously in the dosage of 20 mg. per kilogram of body weight on successive days within twenty-four hours after onset in Shiga dysentery. It does not appear to influence dysentery due to other strains. However, these types of dysentery are usually mild in onset and in all the authors' work have been in progress several days before being seen. The drug does not influence either the course of the disease or the mortality when it is given as late as thirty hours after onset. It is probably of little value when given after twenty-four hours. When the drug is given early, not later than twenty-four hours after onset, it has a decided value in influencing the mortality and the severe toxic course of Shiga dysentery. The mortality with the new treatment in the charity services has not shown a material improvement over previous years. This is attributable, in the authors' judgment, to the fact that the cases in such services are rarely seen until the disease has been in progress for more than twenty-four hours. In the Osceola epidemic (private cases) in which the

drug was administered at the first appearance of diarrhea, only one patient in twenty-six died. The effectiveness of sodium thiocyanate therapy clearly depends on its early use. No claim for sodium thiocyanate (rhodanate) as a specific, either in the prevention or in the treatment of bacillary dysentery, is made by the authors as a result of their clinical experience. Their preliminary results, however, lead them to believe that their method of treatment is worth further trial, and they hope to publish at a later date a much more complete clinical report in which a larger number of institutions and physicians have participated.

Continuous Intravenous Therapy in Infants.—Ashby and Moore have found the scalp by far the most logical site for the continuous administration of a solution in the vein, because (1) the blood vessel is stable, (2) the application is easy, (3) the patient may move or toss the head, the arms and legs being free, and (4) the vessels in this area are the smallest. It is their contention that the greatest difficulty in the use of continuous intravenous administration, i. e., clogging of the needle or cannula by blood, is thus overcome. Many small tributaries of the superficial temporal veins draining the parietal and frontal aspects of the scalp are found in addition to the two or three small tributaries of the frontal and supra-orbital veins, which drain the anterior part of the scalp and flow down over the middle of the forehead. The latter vessels are the authors' first choice, because the child can roll his head from side to side without interfering with the flow of the solution. The infusion is given entirely by gravity. The container is an ordinary 300 cc. arsphenamine tube, connected by a short piece of rubber tubing to a drip bulb, commonly known as the rectal drip, from which a piece of rubber tubing from 3 to 4 feet in length passes to a small glass adapter half an inch in length. The needle, a 28 gage one-half inch so-called tuberculin needle, fits the adapter. The container hangs on the hook of a standard, adjustable in height. This adjustability regulates the rate of flow, which also may be regulated by a screw clamp inserted anywhere between the drip bulb and the needle. The needle may be kept in the vein most efficiently by a 3-inch strip of adhesive tape, 2 inches wide. This is placed firmly over the needle, adapter and skin directly in front of the needle. A small piece of cotton is placed under the adapter. In case of movement of the scalp, the skin, vein and needle move together without disturbing the flow. The rate of flow is judged by the number of drops per minute, this varies from 5 to 30 drops. The first 200 or 300 cc. is allowed to enter the vein at a rate of from 15 to 20 drops per minute, and then the rate of flow is usually reduced to 10 or 12 drops per minute and regulated according to the heart rate, the beginning of diuresis and the clinical appearance of the patient. The solution at ordinary room temperature is regarded as safe. The authors give blood transfusions in the same small blood vessels with the same sized needle. Their transfusion apparatus does not include the drip bulb, but a three way stopcock is inserted. The blood is drawn from the arsphenamine tube into a syringe fitting the stopcock, the valve is turned and the blood injected into the vein slowly. Citrated blood, which is strained when placed in the container, is used. Obstruction of the needle is rare. The authors have employed this procedure in 511 cases.

Relationship of Influenza and Epidemic Encephalitis

—Hurst's study reveals that epidemic encephalitis is an acute disease with an incubation period of about ten days spreading slowly from site to site and tending to persist for a considerable time in the locality affected. In certain cases the infection is through open skin lesions it affects men more than women and attacks parts of the central nervous system especially the basal ganglia. It has a relationship to herpes which is interesting in view of the predilection of that disease for the posterior root ganglia of the spinal cord. The fact that herpes appears in some cases of influenza is of interest but is not sufficient to warrant claim of a common entity for the two diseases in the face of convincing evidence to the contrary. Epidemic encephalitis lacks the catholicity of infection, rapidity of spread and brief duration as a disease, and as an epidemic, the chest attack and the characteristic course, complications and sequels of influenza. The evidence fails in any particular to indicate a common entity for influenza and epidemic encephalitis. It fails to indicate that the presence of influenza predisposes to encephalitis either in the mass or in the individual. The cases diagnosed as influenza at the time of onset in an epidemic which later require a correction of diagnosis to encephalitis are extremely rare. The possibility must be admitted for cases that within a year or two after a disease diagnosed as influenza show unmistakable permanent residuals of epidemic encephalitis—such as masked face, parkinsonian tremor, festinating gait and speech defect with or without mental changes sometimes found in this disease—provided that in the interval there has been no showing of any intercurrent disease which, in sound medical judgment, could be interpreted as epidemic encephalitis.

Management of Malignant Conditions of Thyroid—

In determining the efficacy of surgical and radiation therapy Hicken studied 264 cases of malignant disease of the thyroid. The radiosensitive tumors are the lymphosarcomas the malignant adenomas and the papillary adenocarcinomas. Those which do not respond to either the interstitial or roentgen therapy are the spindle cell sarcomas the carcinoma-sarcomas and the

scirrhous carcinomas. Biopsies should be made of every suspected malignant goiter, for the amount of radiation given depends on the type of neoplasm encountered. Complete removal of the neoplasm is always to be desired. Partial excision of the major portion of the infiltrating tumor cervical decompressions, tracheotomies and biopsies are valuable surgical adjuncts. A combination of surgical and roentgen therapy is more effective than either agent alone. Recurrent malignant lesions should always be excised and the local areas submitted to intensive irradiation. Metastatic lesions offer no contraindications to active surgical and roentgen therapy. The malignant adenoma comprises 90 per cent of all thyrogenic malignant cases and gives an excellent response to surgical and roentgen treatments. Pessimism and apathy have no place in the treatment of malignant goiters.

Epileptic Seizures in Course of Schizophrenia—Falsey presents two cases of typical epileptic seizures in the course of schizophrenia. Both instances occurred in young persons in whom arteriosclerotic and syphilitic factors may be definitely ruled out as possible etiologic factors in the pathogenesis of the seizures. In each instance the seizures were typically epileptic and occurred for the first time during a catatonic exacerbation of a rather long standing schizophrenia. In neither instance have the seizures recurred since the acute catatonic phase of the psychosis has subsided. In one case there was a mild infection (nasopharyngitis) and a mild elevation of non-protein nitrogen (44.4 mg during the period of epileptic manifestations). It appears that the epileptic seizures were either released by the catatonic episodes or were the result of the same etiologic factors involved in the exacerbation of the psychosis. Thus they appear to be a reflection of deep-seated vegetative metabolic or psychobiologic changes, which not only were concomitant with the psychosis but so lowered the convulsive threshold that epilepsy appeared.

Protection of Radium Workers from Gamma Radiation—Kaye and his associates studied experimentally the two main factors of gamma-ray protection, viz., remoteness and lead shielding. The minimal shielding and the tolerance working distance have been determined under various conditions on the assumptions of a daily tolerance dose of 0.2 roentgen and a Sievert gamma-ray unit "dose" of 8 roentgens. The results are also calculable in simple cases from the lead transmission curve of gamma rays, which has also been determined under conditions taking full account of scattering. The results lend support to the recommendations of the International and British Committees for X-Ray and Radium Protection and furnish evidence that the recommendations provide a reliable basis for radium protection, particularly on such points as radium storage, the employment of temporary workers and the importance of expeditious manipulation in busy radium centers.

Method of Sinus Roentgenography in Erect Posture—Fulton submits a method for examining the nasal accessory sinuses in the erect posture, which permits the use of a focal film distance of 4 or 5 feet. The rigid alignment of the x-ray tube and the film permits the use of the smallest possible cone. With a small aperture cone good roentgenograms may be obtained without the use of a Potter-Bucky diaphragm, and the object film distance can thus be reduced to a minimum. For those who desire still further to eliminate scattering it is simple to incorporate a Lysholm grid without much increasing the object film distance. The method permits the taking of four projections on a single 15 by 12 inch film. The apparatus consists of a tube stand, a special caset frame and a telescopic stool. X-rays reach the caset only through a circular aperture, 5½ inches in diameter, which is cut in the center of the frame. Thus, with the caset pressed into each of the four corners in turn, four circular images are obtained on the film, each being 5½ inches in diameter, the centers of these being 6 inches apart. In the subsequent blackening of the surrounding film, the images are cut down to have a diameter of 5 inches in order to allow for any slight error in the centering of the cone. The provision of a rigid head clamp is essential. The most suitable seat for the patient is one in which the height may be varied by the roentgenographer while the patient remains seated. The usual procedure is adopted in fixing the patient's head. In the mentovertex projection, the patient turns round and faces the tube, thus bringing the right side to the left. To preserve a uniform relationship on the film, the caset is turned upside down for this exposure. Generally, 240 milliamperes seconds and a kilovoltage between 55 peak kilovolts for the lateral and 75 peak kilovolts for the mentovertex projection in the average patient are employed. This energy can be delivered through a 2½ kilovolt tube. When the four exposures have been made, the surrounding film is blackened by giving it a light exposure at low kilovoltage through a masking board, which consists of

three layers of three-ply wood. In the center layer the wood is replaced in parts by four disks of 8 pounds of lead, 5 inches in diameter, so placed that they protect the four circular roentgenograms. Embedded in this layer also are the letters R and L (right and left). The board is completed by the addition of two layers of three-ply wood, one on each side of the center portion, all three being firmly glued together. On the top layer, two number guides are countersunk in such a manner that small lead numerals may be slipped into the guides to indicate the date and the patient's serial number.

Fatal Case of Atrophy of Liver After Cinchophen—Fraser cites a fatal case of acute rheumatism, which failed to respond properly to the usual remedies and was then treated with cinchophen. The total amount of cinchophen taken was 37½ grams (244 Gm.), at the rate of one tablet on five successive days. Jaundice appeared five days after the beginning of treatment. The question of idiosyncrasy has been raised by some authorities (Rabinowitz, Weir and Comfort) and probably had some connection in this case owing to the small dose of the drug that was taken. The pathologic features were quite classic and were similar to those of other reported cases, they were of interest from the close resemblance to the condition encountered in cases of trinitrotoluene poisoning. The advisability of the abandonment, or at least better control, of the administration of cinchophen should be considered.

 *Treatment of Cholera with New Anticholera Serum Preliminary Note H. Ghosh—p. 56

Treatment of Cholera with Anticholera Serum—Ghosh obtained by anaerobic culture of the cholera vibrio in a special broth a toxin which, when injected in small doses intravenously in rabbits, produced cholera-like diarrhea. He obtained sufficient corroborative evidence of the presence of a toxin in this medium by experimentally producing cholera-like diarrhea in laboratory animals. This toxin was prepared from only one strain of cholera vibrio, as it was found to produce uniform toxin, provided the medium was prepared exactly according to formula. The production of toxin depended on conservation of the virulence. The author observed clinically that a single sodium chloride transfusion and a single intraperitoneal injection of from 30 to 40 cc of serum, according to the severity of the symptoms, diluted with 200 cc of physiologic solution of sodium chloride diminished the frequency of the stool within two or three hours, and the patient usually passed urine within four to five hours. Of thirty-two cases treated during the second exacerbation of an epidemic, as evidenced from the increase in the rate of mortality in control cases, only four patients died, of whom one was admitted to the hospital three days after the onset of the disease, one died of excessive purging following administration, by mistake, of high doses of sodium phosphate, and the other two died within two hours of admission before the serum could be absorbed. Of 198 serum treated patients forty died, whereas seventy-three of 211 control patients died.

So Called Raynaud's Disease—Lewis and Pickering point out that, if all instances of temporary arrest of the circulation to the finger or to any other part of the body that is particularly prone to become cold and all instances of symmetrical gangrene of digits without demonstrable obstruction to the main arteries of the limb are still to be classed as instances of "Raynaud's disease," a number of quite distinct conditions will continue to be grouped together. Such grouping cannot fail to obstruct inquiry into the causation of the various maladies and to prevent proper appreciation of their natural history. Many distinct maladies are being confused together and their separation is quite essential to the progress of future studies. The authors use the term "Raynaud's phenomenon" to signify active and intermittent closure of small arteries of the order of those supplying the digits, a closure manifesting itself clinically in a pallid or fully cyanotic state of the affected skin. This phenomenon can be a purely spasmodic affair, but it can come also when there is obstructive disease in the digital arteries themselves or in vessels proximal to these. This structural disease being ultimately responsible for the whole circulatory abnormality. The original disturbance may be a sudden and nonrecurring event, leaving behind it a proneness to attacks of cyanosis, which wrongly are regarded as signifying active disease. The events in each case must be regarded on their individual merits, and abnormal vasomotor influences should not be invoked in explanation because it has become the traditional and convenient line of reasoning for the whole group but only when there is clear supporting evidence of such causation. It is a mistake to consider gangrene as the result of an uncomplicated spasmodic disorder. When the circulation to the skin is shut off, there comes into immediate action a mechanism producing vasodilatation and manifesting itself ultimately in reactive hyperemia. Constriction of the vessels, produced through sympathetic channels, will counteract this dilator mechanism in the early stages of its establishment but as ischemia is continued the vasodilator factor will become increasingly intense, and sooner or later the nerves themselves will become functionless locally. Thus it would seem inevitable that a nervous vasoconstriction cannot be maintained sufficiently long to kill the skin. When gangrene occurs a structural change such as thrombosis has happened and permanently plugs the vessel. The view that thrombosis is an important factor must rest ultimately on microscopic demonstration and microscopic examination of the tissues concerned has not yet been carried nearly far enough. The authors suggest that intimal changes including thrombosis are usually or always responsible for the obliteration of small arteries leading to necrosis, and they have in mind not only the isolated attacks of discoloration and necrosis such as are seen in the bilateral digital gangrene but also the minute necrotic foci which form on the fingers in cases that are primarily spasmodic.

Cerebrospinal Fluid Pressure in Arterial Hypertension—Pickering states that the general clinical features presented by hypertensive patients with cerebrospinal fluid pressures of 250 mm of water and more contrast strongly with those presented by patients having lower pressures. The former are younger, the kidneys are usually severely damaged and the disease progresses rapidly to a fatal termination. The latter are older, the kidneys usually escape severe damage and the disease progresses less rapidly. Every patient with a cerebrospinal fluid pressure of more than 250 mm of water developed albuminuric retinitis. With one exception, every patient with a lower cerebrospinal fluid pressure had either no retinal lesion or the lesions characterizing arteriosclerotic retinitis. The author suggests that the essential difference between these two forms of retinitis is the addition in the albuminuric type of neuro-

retinal edema resulting from increased intracranial pressure. In individual patients with high blood pressure, the cerebrospinal fluid pressure has been found unaltered during headache and during acute attacks of coma and convulsions unassociated with uremia. There is a relation between high diastolic blood pressure and high cerebrospinal fluid pressure, and the former is one of the factors determining the latter.

Relationship of Skin and Nerve Leprosy—Muir explains the distinction between neural and cutaneous leprosy by the aid of histologic observations and the leprolin test. The main factor determining the one type from the other is shown to be the degree of resistance. Another important factor is the relatively low resistance and cellular response to lepra bacilli in the subcutaneous nerves as compared with the skin. The importance is dwelt on of the distinction between resistant and nonresistant types in the diagnosis, prognosis, prevention and treatment of leprosy. For examining and comparing early lesions of the cutaneous and neural types, small elliptic pieces of skin and subcutaneous tissue with nerve branches attached are excised from typical macular lesions. Their similarity to the larger macules makes their nature recognizable, and as they are small the whole lesion can be excised. The main clinical distinctions between the neural and cutaneous macule are, in the neural macule, anesthesia on light touch, raised and indurated marked erythema, marked keratosis, anhidrosis and depilation and recognizable hypopigmentation, especially if capillaries are emptied by pressure with a watch-glass, and, in the cutaneous macule, sensation on light touch flat and soft, erythema slight or absent, keratosis, anhidrosis and depilation slight or absent and hypopigmentation generally more easily recognized. There is greater cellular response, in spite of fewer bacilli being present, in the neural than in the cutaneous type of macule. Especially in the cutaneous type there is, in proportion to the concentration of bacilli in the corium and nerves far greater cellular response in the former than in the latter. The bacillary concentration is greater in the nerves than in the corium, this being most noticeable in the neural type.

The Spleen in Blackwater Fever—Charters gives a description of fifteen cases of blackwater fever showing the importance of splenic contraction in the causation of the disease, age incidence and period of residence in the endemic area, tendency to recurrence, prognosis, treatment and prophylaxis. Contraction of the spleen, which is often brought on by stimulation of the sympathetic nervous system, is an essential factor in the causation of blackwater fever. The predisposing effect of blackwater fever is seen only when the last attack has left an enlarged spleen. The prognosis depends on the degree and on the rapidity of contraction of the spleen. The tenderness of the enlarged spleen is an important pre-blackwater fever sign. Immunity is for the most part hereditary in character. Quinine is contraindicated during the hemoglobinuric stage but is a valuable adjunct to treatment when administered in graduated dosage twenty-four hours after the cessation of blackwater fever. Support is given to the theory that post-blackwater pyrexia is due to a persistence of the hemolytic process, relatively mild in degree. Quinine destroys parasites in the spleen by means of its property of causing splenic contraction, which results both in entrance of the drug into the pulp spaces and in expulsion of the plasmodia into the general circulation. In blackwater fever the acute dissolution of malarial parasites is brought about in the same way, the abundance of antitoxin rendering this possible in those cases of the disease which are not preceded by a dose of quinine. A suggested method of treatment is the arrest of splenic contraction by means of spinal anesthesia. Prophylaxis depends on regular abdominal examination and on a course of quinine to any patient who shows enlargement of the spleen. When this organ becomes palpable, administration of the drug is no longer necessary.

Cerebral Accidents Unassociated with Cardiovascular Disease—Ellington draws attention to the occurrence of cerebral vascular accidents in healthy persons without cardiovascular disease, describing four cases that are believed to be of this nature. In none of them were the usual causes of cerebral embolism, thrombosis or hemorrhage present. The sudden onset was suggestive of hemorrhage. In two cases the attacks occurred under circumstances in which it might be supposed that the systolic blood pressure was higher than usual. In the absence of any evidence of cardiovascular disease it seems probable that the vascular disturbance had occurred in or round some preexisting local abnormality. The physical signs in each case suggested a well defined intracerebral lesion. In three cases the combination of aphasia, homonymous field defects involving central vision and transitory sensory disturbance pointed to lesions of the left temporal lobe, while in the other case the signs suggested a destructive lesion in the right cerebellar hemisphere. Although the cerebrospinal fluid was not examined immediately after the attack, no freshly shed blood was found. In two cases the faintly yellow discoloration of the fluid was explained as due to a previous subarachnoid hemorrhage or to an intracerebral hemorrhage at some distance from the ventricle or subarachnoid space. These features make it unlikely that these cases were due to the leakage of cerebral aneurysms. The benign course of the cases makes it improbable that they were due to gliomas, especially as those growths which undergo sudden degenerative change are usually of a rapidly progressive order. A more probable explanation of the nature of these lesions is suggested by the pathologic observations in a similar case which show that a hemorrhage had occurred

into the substance of a preexisting vascular abnormality of the left half of the pons and left middle cerebellar peduncle. This abnormality had the features of a telangiectasis and was not associated with any vascular abnormality elsewhere in the nervous system or in the skin or other organs. Reference to the literature shows that it is not only capillary telangiectases which are liable to give rise to intracerebral hemorrhage in apparently healthy persons, as similar vascular accidents may occur in association with malformations composed of larger vessels—i.e., arteriovenous angiomas. Unlike the capillary telangiectases that are common in the contents of the posterior fossa, the arteriovenous anomalies appear to have a preference for the posterior part of the cerebral hemispheres. The favorable outcome in the author's four cases causes him to speculate on their pathology. However, their close clinical resemblance to other cases in which postmortem examination has been carried out makes it probable that they were caused by hemorrhage into a vascular anomaly of the type of a telangiectasis or an arteriovenous angioma.

Saccular Aneurysm of Thoracic Aorta—Thompson and his associates present a case of saccular aneurysm of the thoracic aorta in which Colt's method of introducing an expanding wire umbrella has proved successful. The patient received a series of blows on the chest directly before the symptoms of aneurysm appeared. In spite of rest and antisyphilitic treatment the aneurysm was increasing in size, protruding between the ribs and reddening the skin, so that rupture seemed an imminent probability. When Colt's umbrella of gold wire was inserted the tumor sank back into the chest and the severe pain was relieved. Since that time regular inspections of the chest have been made and the improvement has continued over a period of three and a half years after the operation. At the last observation the patient was almost free from symptoms and examination of the chest merely showed a slight pulsation over the seat of the aneurysm. The presence of a positive Wassermann reaction showed clearly that the underlying basis was syphilitic, but the onset of symptoms within a few days of receiving severe blows on the chest would point to the trauma being a predisposing cause. The author believes that the indications for the use of Colt's gold wire wisps in cases of thoracic aneurysm appear to be: 1. Definitely saccular aneurysm and not a mere general dilatation of the aorta. 2. Failure of a previous course of rest and antisyphilitic treatment to prevent an increase in the size of the aneurysm. 3. Involvement of the chest wall and reddening of the skin, suggesting imminent rupture of the sac. 4. Evidence of pressure on the esophagus or left bronchus, especially if small quantities of blood have been expectorated.

Purpura in Hepatic Disease—Abrami analyzes the purpura occurring in hepatic disease with a view to deciding whether this is a separate entity. The purpura of hepatic disease presents, he says, all the characters of hemotogenic purpura. The question, then, is whether hepatic changes alone can produce spontaneous capillary ruptures, lengthening of the bleeding time, decrease of platelets and nonretraction of the clot. He concludes that the only one which can be undeniably assigned to the liver is deficiency of blood coagulability. He therefore believes that this group of purpuras belongs with those of hemotogenic type and that the changes of the liver are wholly unable to produce the stigmas of hemotogenic purpura. The existence of a separate hepatic purpura should thus be abandoned.

Galactosuria and Hepatic Insufficiency—Labbé and Neveux examined the value of the galactose test of liver function in normal and diseased persons. Simultaneous examinations of galactosuria and glycemia were made. The subjects were given 40 Gm of galactose dissolved in 200 cc of water before breakfast. The glycemia was measured before breakfast and every following half hour. At the same time urine was collected and analyzed for galactose. If the galactosuria was not ended after three hours collection was continued during the day to obtain the total twenty-four hour galactose excretion. The same method was followed on another day after ingestion of 50 Gm of dextrose. Seven healthy medical students furnished the normal subjects. The test was also carried out on nine patients with alcoholic cirrhosis, two with hypertrophic cirrhosis and diabetes, one with cardiac cirrhosis, two with catarrhal jaundice, one with chronic icterus and lithiasis and five other patients. The results, tabulated in detail were interesting but not superior to the usual dextrose test. If galactosuria is produced more easily than glycosuria, it does not mean a greater difficulty for the liver in fixing galactose or an incapacity of the tissues to use this sugar but simply that the permeability of the kidneys is greater for galactose than for dextrose. Hence there seems to be no valid reason for substituting galactose for dextrose in the functional examination of the liver. The authors also point out that the galactose test must be considered only a test of the glycogenic function of the liver and not an index of general hepatic function since it is well known that liver functions are multiple and relatively independent of one another.

Cancer of Stomach in Pernicious Anemia—Weil and Bernard describe the case of a man with pernicious anemia treated successfully for eight years. Finally death occurred following a short period of aggravated symptoms. Necropsy revealed a typical gastric epithelioma on the large curvature of the stomach with extensive infiltrations. The authors believe that such experiences may become more frequent now that patients with pernicious anemia are usually granted a longer period of life. Two possible explanations are suggested anatomic and functional. It is well known that cancers develop on chronic inflammatory lesions and it is suggested that the

gastric aphasia noted in pernicious anemia may serve in this role. The functional interpretation is based on the possible dissociation of hematopoietic and digestive function in pernicious anemia. Thus the cases of cancer coexisting with or evolving after anemia may be interpreted in an identical manner.

Hypertension in Cranial Traumatism—Wertheimer and Frier believe that the blood pressure should be recorded four times a day after cranial traumatism. The absence of arterial hypertension excludes the presence of a block. The retention of normal arterial tension does not, however, insure a favorable prognosis. The prognosis depends on the clinical signs and their development such as variations of the cerebrospinal fluid pressure. Elevation of the arterial pressure, especially if rapid, associated with a constantly low cerebrospinal fluid pressure indicates the presence of blockage. In cases in which careful lumbar puncture, with drop by drop removal of fluid, lowers the level of arterial tension the diagnosis of 'relative' blockage is indicated, if under the same conditions the arterial tension remains the same, the blockage is complete. On this basis it seems that therapeutic measures may be more accurately applied.

- Variations of Hydroprotein Constitution of Blood Between Artery and Vein P Stefanutti—p 65
- *Hypophonesis on External End of Clavicle According to Pende to Indicate Incipient Apical Changes F L Cassone—p 78
- Primary Pulmonary Carcinoma G Becchini—p 89
- *Alkali Reserve in Hypoglycemia in Normal Persons and Diabetic Patients M Tripodi—p 111

Hypophonesis on External End of Clavicle—Cassone states that the pulmonary apex frequently becomes the seat of the first productive lesions of tuberculosis. He reviews the symptomatology of a patient presenting specific lesions and in whom palpation percussion, auscultation and roentgen examination of the apical regions were made. He discusses the value of each of these signs and their possible causes of error. Percussion was done on the external end of the clavicle, according to Pende, in patients having presented apical lesions in previous examinations and in patients in whom a diagnosis of a specific initial form was made from ectoscopic and anamnestic symptoms. The author found that in the first group of patients percussion indicated dullness in a clearer and more precise manner than when percussion was done on the apical region. In the second group percussion indicated immediately the localization of the disease and showed apical involvement. This was confirmed in many patients by a roentgenogram showing opacity and small dark circumscribed spots of the apex and also by auscultation revealing fine and fixed rales. Having observed that the dullness on the external end of the clavicle is present when there are no trophic changes of the muscles of the shoulder and even when the signs of apical catarrh are lacking the author concludes that it is one of the early appreciable pulmonary signs of apical lesions and is of marked symptomatologic value for the diagnosis of incipient tuberculosis.

Alkali Reserve in Hypoglycemia—Tripodi studied the behavior of the alkali reserve during the course of hypoglycemia artificially induced by subcutaneous injections of insulin in normal persons and diabetic patients. He found that the postinsulin glycaemic depression is constantly accompanied by a decline in the alkali reserve of normal persons and patients presenting mild nonacidotic diabetes. This decline coincides with the appearance of hypoglycemic symptoms and is proportionate to their gravity. In grave acidotic diabetes there is an increase in the alkali reserve in the first stage and, when in the second stage the glycaemic rate falls below a certain limit, variable in diabetic patients, there is a decline in the alkali reserve. Contrary to what was observed in normal persons and in patients with mild diabetes, the appearance of the first hypoglycemic symptoms does not coincide with a diminution of the alkali reserve but with an increase in it. If the hypoglycemic symptoms become more serious, the alkali reserve is lowered but not always to the level preceding the administration of insulin. The author injected large doses of sodium bicarbonate intravenously in normal persons and in diabetic patients during hypoglycemic symptoms. This injection exerts a favorable action on mild hypoglycemic symptoms, such as

perspiration, tremors, nervousness and rapid pulse. It does not arrest their evolution or improve the more serious hypoglycemic manifestations, such as debility, somnolence, convulsions and coma.

Advantages of Buffer Action in Treatment of Eczema A. Papendieck — p. 269

*Multiple Fibromatosis of Skin After Frost Bite D. A. Zipersson — p. 279

Complement Fixation in Fungus Diseases—Foldvari used in his studies of complement fixation in fungus diseases two antigens: (1) a polyvalent antigen prepared from *Achorion Quinckeanum*, *Achorion Schoenleinii* and various strains of *Trichophyton* and of *Epidermophyton*, and (2) an antigen prepared from strains of *Trichophyton gypsum*. He concludes that antibodies producing complement fixation are produced in considerable quantities in the deep seated fungus diseases. In the more superficial processes, the antibodies are formed in smaller quantities. Vaccine therapy promoted antibody formation in some of the cases, while in others it exerted no influence on the antibodies. The complement fixation test was of no value for the prognosis. The vaccine had the same therapeutic effect, whether the antibodies were increased or not. The allergic reactions did not always run parallel with the complement fixation reactions. It appears that the reactions are group reactions. The deviation of the complement seems to be of diagnostic value in fungus diseases with deeper processes (blastomycosis, sporotrichosis) or with eczematous or dyshidrotic changes in which the microscopic or cultural demonstration fails.

Multiple Fibromatosis of Skin After Frost Bite—Zipersson describes the case of a woman, aged 30, who had approximately 800 nodules and tumors. She stated that the disorder began at the age of 2, after she had been exposed for a long period to the cold of winter. The histologic examination of two growths corroborated the diagnosis of multiple fibromatosis of the skin. The author mentions other writers who have observed cases of fibromatosis of the skin after exposure to cold. The multiplicity is especially characteristic for these fibromas. The growths are distributed over the entire body. The mechanism of development of the fibromas is not completely understood, but several theories have been suggested. The prognosis is rather unfavorable, since there is danger of malignant degeneration, necrosis and calcification. Treatment is generally of little avail, but, if the fibromas become large, surgical intervention is advisable.

Carbohydrate Metabolism and Its Modification by Creatine—Jahn shows that it is necessary to determine, in addition to the blood sugar curve after the dextrose tolerance test, the fluctuations in the lactic acid content and in the ketonic acid content so as to obtain information about the site of the utilization of sugar. Dextrose tolerance tests with and without physical exertion reveal the great differences in the rapidity of the utilization of sugar during rest and during physical exertion. Observations make it probable that substances from the muscular metabolism play a part in the regulation of the utilization of sugar. Studies on the metabolic action of creatine reveal a tendency to limitation of combustion of sugar in the tissues. In case of glycogen deficiency in the liver, there develops after the application of creatine a considerable ketonemia and a reduc-

tion in the blood sugar content. However, the reduction in the lactic acid content of the blood is observable in all cases. Creatine promotes the insulin action on the glycogen formation in the muscles and supports the blood sugar reducing action of the hormone. The contradictory changes in the lactic acid and in the ketone body contents of the blood can be explained by the action of the muscular substances that increase the insulin action. If clinical examination reveals a disturbance in the carbohydrate metabolism with hypoglycemia and ketonemia, the disturbance should be brought into relation with the reduction of the blood sugar after muscular exertion and carbohydrate intake and with the aspects of spontaneous hypoglycemia.

Galvanic Skin Reflex in Sympathetic Neuroses—Essen points out that the sympathetic apparatus of persons with a sympathetic neurosis has a deficient compensation capacity. He demonstrated this in the galvanic skin reflex that develops after a short cough. He tested this reflex in forty-six healthy persons and eighty-two persons with a sympathetic neurosis. Of the forty-six healthy persons, forty showed normal reflex action, and of the eighty-two with sympathetic neurosis, sixty-three showed a pathologic reflex. The abnormal reflex action was indicated by a prolongation of the latent time and of the time of disappearance and by fatigability and an undulated outline of the reflex record. The author concludes that the abnormal galvanic skin reflex is a frequent and significant sign of sympathetic neuroses. The galvanic skin reflex exemplifies that the dynamic course of sympathetic regulations is abnormal in persons with sympathetic neurosis.

Green Fluorescence in Blood Serum—To determine the degree of urobilinemia in disorders of the liver or the kidney, Brunner employed his method for the quantitative determination of the maximal green fluorescence in the blood serum. He devised this method because Heilmeyer's quantitative determination of urobilinogen proved satisfactory only for the examination of feces and urine but not for the blood serum. To 1 cc. of blood serum the author adds 0.5 Gm. of pulverized zinc acetate, mixes well and lets it stand for twelve hours at room temperature. Then he adds 7 cc. of absolute alcohol and shakes well. This mixture has to stand for twelve hours and then is filtered into test tubes. The absolutely clear filtrate is examined colorimetrically in the arc light simultaneously with a series of dilutions of ethoxy-diamino-acridine-lactate (from 1:200,000,000 to 1:10,000,000). To obtain a clearer picture of the quantities of urobilin, the values were changed by computation into milligrams per hundred cubic centimeters. The normal urobilin content of the blood serum is estimated at between 0.0628 and 0.125 mg. per hundred cubic centimeters of blood serum, which corresponds to a solution of ethoxy-diamino-acridine-lactate of from 1:200,000,000 to 1:100,000,000. The author found that the determination of the urobilinemia is a more reliable and exact indicator for the disordered hepatic function than is urobilinuria. This could be observed particularly in insufficiency of the kidneys. In icterus that is caused by complete occlusion and in catarrhal icterus there exists in spite of fecal acholia and of usually greatly reduced urobilinuria a severe urobilinemia (autochthonous formation of urobilin in the liver). In chronic, true uremia uncomplicated by cardiac insufficiency and cirrhosis of the liver, the urobilinuria remains within normal limits. This indicates that the liver is not involved in the development of true uremia. The author thinks that the anemias accompanying uremia are probably not the result of increased hemolysis but rather of the toxic insufficiency of the bone marrow.

Primary Point of Attack of Allergens as Foundation of Allergic Tests and Therapy—Urbach states that the foundation of every clinical manifestation of an allergic dis-

order is an antigen antibody reaction. In the individual case, the manifestation of the allergy is dependent less on the antigen but almost entirely on the localization of the cellular antibodies. The author reproduces a table in which the allergic diseases and the principal point of attack of the allergens are put in opposite columns. Classification of the allergies on the basis of the site of the antigen antibody reaction explains why only a test that is performed on the shock organ can give information about the type and degree of allergization of the involved tissue. Moreover, it makes a more effective therapy possible, for only such desensitization is effective that considers the primary point of attack (epidermal, vasculocutaneous, vasculo-cerebral, epimucobronchial, leiomyobronchial and so on) and that is applied to the involved organ (epidermis, cutaneous vessels, bronchial mucous membrane, bronchial musculature and so on). If a few exceptions are disregarded, the clinical manifestations of an allergy are almost entirely determined by the organ in which the antigen antibody reaction takes place. Allergic eczema was one of the conditions in which the primary site of the cellular antibodies was disputed. Whereas Kyrle considered the epithelial hypersensitivity the only basis of eczematous manifestations, Jadassohn and his collaborators came to the conclusion that a purely epithelial hypersensitivity without the involvement of the cutaneous vascular system is not likely and assumed a vasculo-epithelial allergic origin. The author thinks that in eczema the primary site of the antibodies may be epithelial as well as vascular. Recent histologic studies indicate that the reticulohistiocytic elements of the epidermis (the so called Langerhans cells) and those of the cutis (the capillary endothelials of the papillary blood and lymph vessels) form a connected system, the so-called endothelial-Langerhans system. This would explain how a primary epidermal hypersensitivity later becomes elicitable by way of the vascular system. The differentiation of primary epithelial from primary vascular eczemas is done by epinephrine-iontophoresis. Just as in the skin, a differentiation is possible also in case of the mucous membranes (primary epimucous and primary vascular).

Hemolytic Anemia—Spherocytic Disease—Leindorff shows that there are two types of hemolytic anemias, the idiopathic and the symptomatic forms. The latter type is usually caused by chemical or bacterial toxins, while the first type is endogenic, a congenital 'hematic diathesis'. The diathesis may remain latent for a long time, but its manifestation may be brought on by various factors, such as infections, exposure or overexertion. When fully developed, the disease presents three characteristic symptoms: icterus, anemic pallor and splenic tumor combined with three hematologic signs: microcytosis, reduced resistance of the erythrocytes to hypotonic solution of sodium chloride and increase of reticulocytes. However, these symptoms need not all be present at the same time. In children the icterus is almost never severe and in some instances it is entirely absent. There are also cases without splenic tumor and some without pallor. The most characteristic signs of the disease are found on examination of the blood. The most important symptom is the microcytosis. The diameter of the erythrocytes is only 58 microns instead of 78 microns as in normal persons. Moreover, these are not the small erythrocytes, the micropoikilocytes, found in most forms of anemia. Instead of being disk shaped they are spherical and in spite of their smaller diameter they have a greater volume than the normal erythrocytes (100 cubic microns instead of 88). For this reason the author thinks that for this type of cells the term spherocytes is better than the term microcytes. The hemoglobin content of the spherocytes is comparatively high,

which explains the relatively high color index of 1 or higher in this type of anemia. Because the disk-shaped erythrocytes are the only suitable ones, it may be assumed that the organism tries to eliminate the spherical types by an increased activity of the reticulo endothelial system, particularly the spleen. This results in splenic tumor. Icterus develops if the liver is no longer capable of utilizing the excessive amounts of pigment. The author thinks that the nature of hemolytic anemia is explained best by assuming a congenital abnormality of the erythropoietic system, as the result of which it produces spherical instead of disk-shaped erythrocytes. To support further the opinion that the spherical form of the erythrocytes is the essential factor in hemolytic anemia, he mentions other hemolytic conditions that are characterized by erythrocytes of abnormal shape. He calls attention to sickle-cell anemia and to erythroblastic anemia. He compares the main aspects of these two types with the described type and shows that the different types are characteristic for different races, the sickle-cell anemia, for instance, for the Negro race. In regard to the therapy of hemolytic anemia, he states that treatment is unnecessary during the latent stage and that blood transfusion is advisable during the acute attack. Occasionally treatment with liver and iron may be helpful. Splenectomy should be done only in case of repeated hemolytic crises.

Prophylactic Vaccine for Whooping Cough—Kaupé reports his experiences with whooping cough vaccine in a home for nurslings and an orphans' home connected with it. In the nurseries and children who had whooping cough, the vaccination resulted in a prompt cure. All other children were given three prophylactic injections of vaccine and, although they had been in contact with the children who had whooping cough, they remained free from it. The author emphasizes that all the children, even the infants of from 1 to 6 months, tolerated the vaccine well. The only symptom produced by the injections was a slight temporary increase in the temperature.

*New Treatment of Congenital Dislocation of Hip Joint by Means of Straddle Bandage F Bauer —p 110

Treatment of Congenital Dislocation of Hip Joint—Bauer says that the treatment of congenital dislocation of the hip joint with nonsurgical reduction and prolonged subsequent fixation had two aims: the correction of the abnormal position of the joint and the permanent retention of the head in the acetabulum. He devised a method which, in addition to these two aims has a third, the stimulation of the joint. He tries to accomplish this by excluding fixation from the treatment, because he considers it harmful for two reasons. It inhibits the joint stimulating action and produces atrophy of all parts of the joint. The new feature of his method is the straddle bandage. Reduction is done immediately after the condition has been recognized. It can be done during the first few weeks of life. Then the straddle bandage is adjusted. It can be made of rep ribbon from 25 to 3 cm in width. A girdle that can be buttoned in front is placed round the thorax, and two shoulder straps secure the girdle against downward pull. Well fitting slings grasp both legs below the knee, and two pieces of ribbon of the proper length to secure correct abduction connect the slings of the legs with the girdle in the back. In case of slight abduction they are usually fastened on the same side, while in case of greater abduction they are fastened crosswise, on opposite sides. In older children, ribbons may be fastened also on the front of the girdle and connected with the slings round the legs. To secure continuous maximal abduction, a rod with holes at both ends may be fastened on the slings. Even if this is done there is still considerable freedom of movement. The bandage can be changed and washed. It is advisable to keep the bandage on during the daily bath. The author employed this bandage successfully in fourteen cases of congenital subluxation and in six cases of congenital dislocation. The treatment produces the best results if employed during the first year of life.

calculi were treated and sectioned in the same manner as were the concretions from rabbits. The phosphate calculi, nearly all of which contained cocci, showed the same microscopic pictures as did the experimental rabbit concretions. In the ovalate concretions the similarity was not so pronounced. The development of the primary bodies is supposedly due to the saturation of small drops of a colloidal or protein-like substance with urinary salts, or to the fact that the flocculation of certain colloidal substances takes place in combination with electrolytes. This would explain the atypical crystal shape and the succession of layers, of which one always has a high electrolyte and a low protein content, while the next one has the reverse composition. The author thinks that the protein substances involved in calculus formation are probably not normal but are colloids that have undergone changes and are foreign to the urine, and it appears that the staphylococci play a determining part in this process. The simultaneous modification of the urinary chemistry by these micro-organisms is the second factor in the development of the calculi. The examination of two vesical calculi, which had developed in rats under the influence of food deficient in vitamin A, revealed that they had an entirely different pathogenesis. It appears that lime debris and lime clots became deposited on cast-off epithelial cells or on groups of cells. A similar development could be observed in a rabbit following the introduction of colon bacilli. The duplication of the experiments of Rosenow and Meisser, namely, the production of renal calculi in dogs by infection of the pulp cavity, produced negative results. The attempt to produce concretions in rabbits by the continuous administration of the hormone of the parathyroids or by this hormone and the introduction of staphylococci (without ureteral stasis) resulted only in insignificant calcifications in a few of the renal tubules.

Sodium Chloride in Metabolism During Urologic Disturbances.—Strauss points out that the part played by sodium chloride in the metabolism during urologic disturbances, particularly hypertrophy of the prostate, requires especial attention, for disturbances are likely. Whereas the kidney plays the most important part in the elimination of sugar and of the substances containing nitrogen, its significance in sodium chloride elimination is secondary to that of extrarenal factors. Sodium chloride elimination has no essential significance as an indicator for the renal function, but the sodium chloride tolerance test and the determination of the elimination are important. The examination of the concentration capacity of the kidney by one or repeated tolerance tests permits conclusions about the functional capacity of the kidney. In all forms of hypertrophy of the prostate in which renal changes exist, the sodium chloride elimination is abnormal following the tolerance test. The renal impairment characteristic of hypertrophy of the prostate is a hydropnephrosis due to stasis. The changes developing in case of hypertrophy of the prostate, when considered from the point of view of the elimination of sodium chloride, can be divided into three groups. Hypertension belongs to the first group in which the elimination is normal with and without tolerance tests. To the second group, in which the elimination is abnormal during the tolerance test, belong the disorders that present the aspects of focal nephritis or of the benign and incipient stages of malignant sclerosis. The third group comprises the late forms of malignant sclerosis, in which the extrarenal factors predominate and the elimination is abnormal during and outside of the tolerance test. The extent of the renal changes and of the disturbance in the sodium chloride elimination depends on the degree and the duration of the hypertrophy of the prostate and on the intensity of the stasis. Uniform evaluation of the sodium chloride content of the serum in the course of the disease encounters considerable difficulties. Normal as well as subnormal values of the sodium chloride content of the serum are encountered in patients with hypertrophy of the prostate. Occasionally, but not always, there develops during the stage of renal insufficiency, together with the azotemia, a hyperchloremia. The sodium chloride content of the serum requires especial consideration during the period after urologic operations. Postoperative disturbances belonging to the group of hypochloremic azotemia have been observed. The reduction of the chloride values of the serum after prostatectomy or other

urologic operations, together with the postoperative increase in the nonprotein nitrogen, may produce the manifest or the masked forms of this syndrome. The sodium chloride deficiency, due mostly to dietetic factors, produces a general impairment of the cells as the result of reduction of the osmotic pressure. The retention of the nitrogen containing substances in the blood represents an attempt of the kidneys to maintain the osmotic pressure. Decrease of the chloride content of the serum and increase in the rest nitrogen produce uremia-like aspects that are easily misunderstood. The prostatectomy frequently taxes the organism to such an extent that it is no longer capable of compensating for the masked metabolic disturbance. For this reason sodium chloride elimination should be given especial attention because adequate administration of sodium chloride will counteract the metabolic disturbance.

Atherosclerosis of Abdominal Arteries.—According to Malyatskaya, abdominal angina has been considered by the majority of authors a clinical entity analogous in its course to angina pectoris and to intermittent claudication. Sclerosis of the abdominal aorta and of the arteries of the abdominal viscera has been considered the cause. The theories regarding the mechanism of pain production are (1) anemia of the intestinal wall resulting from narrowing of the arterial lumen by the sclerotic process, (2) alterations in the smallest arteries of the intestinal wall and in the arteries of the sympathetic abdominal ganglions, and (3) periarteritis of the sclerotic vessels and of the abdominal aorta with the extension of the inflammatory process to the neighboring sympathetic ganglions. The author studied the histories of twelve selected cases of pronounced arteriosclerotic alterations of the abdominal arteries. The celiac artery and its branches as well as the superior and inferior mesenteric arteries and their branches down to the caliber of from 2 to 3 mm were investigated. The material was divided into two groups: six cases of pronounced sclerotic alterations of the abdominal arteries and six cases of even more advanced atherosclerosis. The symptoms in these cases did not suggest the existence of abdominal angina. In the second group the intima of the large arteries presented confluent sclerotic plaques. In one case there was almost complete thrombotic occlusion of the origin of the superior mesenteric artery and marked narrowing of the lumen of the celiac and the inferior mesenteric arteries. The author concludes that advanced sclerosis of the abdominal arteries leads to considerable narrowing of the lumen of the main arteries. This alteration, however, was not found to lead to pronounced alterations in the abdominal viscera. Alterations analogous to those found in the myocardium in cases of coronary sclerosis were not found in the intestinal wall. The author concludes that the existence of even most pronounced atherosclerosis of abdominal arteries is not sufficient alone to cause manifestations of abdominal angina.

Effect of Malaria on Pulmonary Tuberculosis.—In 800 necropsies on patients who died from acute or chronic malaria Shirokogorov found an incidence of a primary tuberculous focus in about 25 per cent. The appearance of the focus, of the adjacent tissue and of the remote organs showed the absence of signs of secondary reactivation of the primary tuberculous infection under the influence of acute or chronic malaria. This fact was particularly noteworthy in the cases of chronic malaria complicated by grave anemia, at times of a progressive malignant type characterized by bone marrow atrophy, profound metabolic disturbances in the form of fatty or amyloid

calculi were treated and sectioned in the same manner as were the concretions from rabbits. The phosphate calculi, nearly all of which contained cocci, showed the same microscopic pictures as did the experimental rabbit concretions. In the oxalate concretions the similarity was not so pronounced. The development of the primary bodies is supposedly due to the saturation of small drops of a colloidal or protein-like substance with urinary salts, or to the fact that the flocculation of certain colloidal substances takes place in combination with electrolytes. This would explain the atypical crystal shape and the succession of layers of which one always has a high electrolyte and a low protein content, while the next one has the reverse composition. The author thinks that the protein substances involved in calculus formation are probably not normal but are colloids that have undergone changes and are foreign to the urine, and it appears that the staphylococci play a determining part in this process. The simultaneous modification of the urinary chemistry by these micro organisms is the second factor in the development of the calculi. The examination of two vesical calculi, which had developed in rats under the influence of food deficient in vitamin A, revealed that they had an entirely different pathogenesis. It appears that lime debris and lime clots became deposited on cast-off epithelial cells or on groups of cells. A similar development could be observed in a rabbit following the introduction of colon bacilli. The duplication of the experiments of Rosenow and Meisser, namely, the production of renal calculi in dogs by infection of the pulp cavity produced negative results. The attempt to produce concretions in rabbits by the continuous administration of the hormone of the parathyroids or by this hormone and the introduction of staphylococci (without ureteral stasis) resulted only in insignificant calcifications in a few of the renal tubules.

Sodium Chloride in Metabolism During Urologic Disturbances.—Strauss points out that the part played by sodium chloride in the metabolism during urologic disturbances, particularly hypertrophy of the prostate, requires especial attention for disturbances are likely. Whereas the kidney plays the most important part in the elimination of sugar and of the substances containing nitrogen, its significance in sodium chloride elimination is secondary to that of extrarenal factors. Sodium chloride elimination has no essential significance as an indicator for the renal function, but the sodium chloride tolerance test and the determination of the elimination are important. The examination of the concentration capacity of the kidney by one or repeated tolerance tests permits conclusions about the functional capacity of the kidney. In all forms of hypertrophy of the prostate in which renal changes exist, the sodium chloride elimination is abnormal following the tolerance test. The renal impairment characteristic of hypertrophy of the prostate is a hydronephrosis due to stasis. The changes developing in case of hypertrophy of the prostate, when considered from the point of view of the elimination of sodium chloride, can be divided into three groups. Hypertension belongs to the first group in which the elimination is normal with and without tolerance tests. Normal as well as subnormal values of the sodium chloride content of the serum are encountered in patients with hypertrophy of the prostate. Occasionally but not always there develops during the stage of renal insufficiency, together with the azotemia, a hyperchloremia. The sodium chloride content of the serum requires especial consideration during the period after urologic operations. Postoperative disturbances belonging to the group of hypochloremic azotemia have been observed. The reduction of the chloride values of the serum after prostatectomy or other

urologic operations, together with the postoperative increase in the nonprotein nitrogen, may produce the manifest or the masked forms of this syndrome. The sodium chloride deficiency, due mostly to dietetic factors, produces a general impairment of the cells as the result of reduction of the osmotic pressure. The retention of the nitrogen containing substances in the blood represents an attempt of the kidneys to maintain the osmotic pressure. Decrease of the chloride content of the serum and increase in the rest nitrogen produce uremia-like aspects that are easily misunderstood. The prostatectomy frequently taxes the organism to such an extent that it is no longer capable of compensating for the masked metabolic disturbance. For this reason sodium chloride elimination should be given especial attention because adequate administration of sodium chloride will counteract the metabolic disturbance.

Atherosclerosis of Abdominal Arteries.—According to Malyatskaya, abdominal angina has been considered by the majority of authors a clinical entity analogous in its course to angina pectoris and to intermittent claudication. Sclerosis of the abdominal aorta and of the arteries of the abdominal viscera has been considered the cause. The theories regarding the mechanism of pain production are (1) anemia of the intestinal wall resulting from narrowing of the arterial lumen by the sclerotic process, (2) alterations in the smallest arteries of the intestinal wall and in the arteries of the sympathetic abdominal ganglions and (3) periarteritis of the sclerotic vessels and of the abdominal aorta with the extension of the inflammatory process to the neighboring sympathetic ganglions. The author studied the histories of twelve selected cases of pronounced arteriosclerotic alterations of the abdominal arteries. The celiac artery and its branches as well as the superior and inferior mesenteric arteries and their branches down to the caliber of from 2 to 3 mm were investigated. The material was divided into two groups: six cases of pronounced sclerotic alterations of the abdominal arteries and six cases of even more advanced atherosclerosis. The symptoms in these cases did not suggest the existence of abdominal angina. In the second group the intima of the large arteries presented confluent sclerotic plaques. In one case there was almost complete thrombotic occlusion of the origin of the superior mesenteric artery and marked narrowing of the lumen of the celiac and the inferior mesenteric arteries. The author concludes that advanced sclerosis of the abdominal arteries leads to considerable narrowing of the lumen of the main arteries. This alteration, however, was not found to lead to pronounced alterations in the abdominal viscera. Alterations analogous to those found in the myocardium in cases of coronary sclerosis were not found in the intestinal wall. The author concludes that the existence of even most pronounced atherosclerosis of abdominal arteries is not sufficient alone to cause manifestations of abdominal angina.

Effect of Malaria on Pulmonary Tuberculosis.—In 800 necropsies on patients who died from acute or chronic malaria Shirokogorov found an incidence of a primary tuberculous focus in about 25 per cent. The appearance of the focus, of the adjacent tissue and of the remote organs showed the absence of signs of secondary reactivation of the primary tuberculous infection under the influence of acute or chronic malaria. This fact was particularly noteworthy in the cases of chronic malaria complicated by grave anemia, at times of a progressive malignant type characterized by bone marrow atrophy, profound metabolic disturbances in the form of fatty or amyloid

SHOULD THE NUMBER OF PROFESSIONAL STUDENTS BE RESTRICTED?

RAYMOND WALTERS, A.M., Litt.D., LL.D.
President University of Cincinnati
CINCINNATI

Should the number of professional students be restricted? This is no medieval, metaphysical question. It is as real as fresh paint on a front door, as timely as today's newspaper, as uncertain as anything that may happen tomorrow.

The question may be approached from three angles. One may approach it from the angle of personal interest. To do so is not necessarily to be selfish. For those of middle age or beyond, the answer is not of immediate concern, for whatever happens they can somehow wag along. Their personal interest is likely to center in the careers of their children and of young friends and students who come to them for counsel.

One may approach the question from the angle of professional interest. Proud of the past of the profession, imbued with its ethics and its spirit, one may honorably argue for its maintenance as it has been built up by the patient labors and the accumulated wisdom of countless workers in the field.

But I am confident that the reader will approve a third approach, that from the angle of general interest, an impartial consideration of this question as bound up with the national problem of professional service in relation to the public weal, an approach that stresses the good of the people as a whole.

In seeking an answer to the question of whether the number of professional students should be restricted I propose to do three things:

1 To present facts as to the actual numbers in the professions, giving them in clear and orderly fashion without statistical details.

2 To quote views of advocates of differing interpretations and proposals.

3 To venture an opinion that seems to issue from the facts and from other related facts and circumstances.

As to my presentation of facts, may I explain that this very topic is on the agenda of a committee of the American Council on Education, the Committee on Standards, of which I am chairman, and that members of this committee have cooperated in collecting pertinent studies relating to the professions of law, medicine, college and university teaching, and engineering.

Read before the Annual Congress on Medical Education, Hospitals and Laboratories, Chicago, Feb. 18, 1935.

NUMBERS IN VARIOUS PROFESSIONS

What are the facts regarding numbers in the professions during recent normal years?

Profession of Law—An answer for the profession of law is presented in a tabulation by the National Conference of Bar Examiners and also in a study made by a member of the Committee on Standards of the American Council on Education, Mr. Alexander B. Andrews. The tabulation of the Bar Examiners¹ cites the 1930 census, which shows 160,605 lawyers in the forty-eight states and the District of Columbia. This was an increase for the country of 31 per cent over the number in 1920, as compared with an increase of 16 per cent in the population for the decade.

The per capita proportion in 1930 was approximately one lawyer for every 762 persons. There were 131 lawyers for each 100,000 of population for the country as a whole. Considerable variation was revealed as to states and the observation of the Bar Examiners was that "lawyers are more plentiful in the large cities" and that the ratio is increasing more rapidly in the large cities.

Interesting comparisons with numbers in the legal profession in European countries were afforded in an address² by Mr. Andrews as president of the North Carolina Bar Association in 1929, based on information in *Juristische Wochenschrift*, a weekly legal journal of Germany. These comparisons may be most compactly presented in the accompanying table.

One commentator observed³ that, while "the demand for the quantity of legal services in such countries is less than in the United States, yet in no foreign country is the population per lawyer nearly so small as in the United States."

College and University Teaching—Facts about the number of teachers in colleges and universities in the United States are provided by the reports of federal departments and of the weekly educational journal *School and Society*.

In 1929-1930 the teaching staffs of 1,078 universities, colleges and professional schools totaled 71,722 persons.⁴ In addition there were 14,463 teachers in 331 normal schools and teachers' colleges, making a grand total of 86,185 collegiate teachers.⁵

In their 1934 enrolment figures reported to me as a member of the staff of *School and Society*, 567 approved institutions had a total of 67,521 teachers. The ratio

teach for some time. Special arrangements had to be made for Jewish physicians who could not be licensed by a representative of the pope, in such cases the license was issued by the faculty.⁷ Whoever practiced without a license was excommunicated and, in addition, persecuted by the municipal authorities. The license gave a physician the privilege of practicing in all Christian countries. In Paris, the formula spoken by the chancellor when conferring the license was:⁸

Ego, cancellarius, auctoritate apostolica, qua fruor in hac parte, do vobis licentiam legendi, interpretandi et faciendi medicinam hic et ubique terrarum. In nomine Patris, et Filii,

—I, the Chancellor, by the power invested by my apostolic authority that I exercise in these parts, confer on you the faculty to teach, to interpret, and to practice medicine here and in all countries. In the name of the Father the Son,

When a physician moved to another city, he had to submit to certain formalities. First of all the municipal authorities had to grant him permission to settle down, a permission that everybody had to seek, whether he was a physician or not. Then the physician had to present his diplomas to the university of the place and have his privileges renewed. This consisted in the paying of a fee and another disputation, the idea of which was to demonstrate that the candidate not only had degrees but was still conversant in the subject. Endless conflicts resulted if a man did not readily submit to these formalities. History tells of many such cases. Paracelsus in 1527 was invited by the city authorities to practice medicine in Basel and was appointed municipal physician. Being a doctor of the University of Ferrara, he was entitled to lecture at the university but, stubborn as he was, he refused to submit to the required formalities and the result was a permanent hostility of the university toward him, which eventually contributed to his peremptory departure from Basel. Johannes Sambucus, a Hungarian physician, practiced in Vienna without having shown his credentials to the faculty, whereupon the faculty in 1567 denounced him to the city authorities, and he would have been expelled from the city had not the emperor Maximilian II interfered.⁹

In cities where there were no universities the physician was compelled to present his diplomas to the city authorities, usually to the board of health. The fact that many, and among them some of the largest, cities had no universities led to the establishment of special medical organizations, as for instance the Royal College of Physicians in London, which was granted a charter, Sept 23 1518. It consisted originally of eight persons, and its purpose was to improve and regulate the exercises of the art of physic. No person except a graduate of Oxford or Cambridge was allowed to practice medicine in England unless he had been examined and approved by the president and three members of this college. This example was followed a century later by Scotland. The fact that irregular practitioners intruded in increasing numbers in Scotland made the need for such an institution strongly felt, and an application was made in 1617 to King James I of England for the establishment of a college, according to which the practitioners of medicine in Scotland should be incorporated into a Royal College of Physicians, which was to appoint

seven members to examine all those who intended to practice in Scotland. The exercise of medicine without a diploma of the college was to be made illegal. Although the application was favorably received at the court, the political conditions delayed the founding of the college, but in 1681 a charter was granted to the college. It is interesting to note that the universities, the municipal corporations and even the bishops and archbishops opposed the founding of the college violently, as they considered this an intrusion into their own rights and privileges. While so far the universities had been the only licensing bodies, from then on, in England and Scotland, licenses were granted by medical organizations,¹⁰ i. e., by medical practitioners.

The medieval university was a powerful, well organized body which not only transmitted knowledge but considered it its duty to keep the traditions pure. It was fully aware of its responsibilities, and the license issued by a faculty of medicine was a full guaranty of the adequate knowledge of its bearer. In the centuries following the Renaissance, the universities lost their high standing. They did not follow the trend of the times. They clung to the old traditions. A new medical science developed, and it developed outside the universities, centering its efforts around the new academies. In the Middle Ages most universities were controlled by the church, and thus guaranteed equal standards. After the Reformation the conditions were greatly changed. The church lost its grip on many of the universities, and there was a marked tendency toward state interference in university matters. In the seventeenth and eighteenth centuries the standard of the universities became more and more unequal. While some of the universities were still conscientious in delivering degrees, others became lax. A degree of such a university was therefore no longer a guaranty of a graduate's fitness to practice medicine, and the states began to protect themselves by disregarding the academic degree.

LICENSURE IN PRUSSIA

Until 1725, whoever had a master's degree of a medical faculty could practice medicine in Prussia, and whoever had a master's patent of a surgeon's guild could practice surgery. In 1725, however, a bill was passed according to which the master of medicine could not exercise his profession before he had taken a course in anatomy and discussed a *casus medico-practicus* before the *collegium medicum* and the *medico-chirurgicum*, which was a state board of health.¹⁰ The right of licensure was therefore taken from the universities and assumed by the state. New regulations were passed in 1789 and 1791, the candidate was examined "in the most important subjects of medicine." In other words, he now had to take two examinations, one for his doctor's degree at the university and, in addition, one for the license before a state board. After the unification of Germany, the license obtained in one of the states gave the privilege of practicing in all the other states, and it was decided that the state examination should be given by the physicians most competent in the matter, namely, by the university professors of the medical faculties. In this way one avoided submitting the candidates to two examinations, which would be a mere repetition and a waste of time, the doctor's degree was conferred after the candidate had passed his state examination and had submitted an inaugural dissertation. The universities had been reorganized in the

At Yale, from 1918 to 1928, the student body in the four nonprofessional schools of the university increased 77 per cent, while the faculty number increased 74 per cent. In its 1928 report, which cites these figures, the Yale Faculty Committee ascribed the progressive increase in the number of the faculty as 'a determining factor in preventing the salary scale from increasing in proportion to the university's income' ¹⁶

The teaching profession has its economic future largely in its own hands. If methods are developed for keeping down the teacher student ratio, so as to hold the faculty at about its present size, while still giving effective instruction in the larger subjects, a steady improvement in the economic status of the profession may be expected.

Evidence in another direction as to trends in certain American colleges was reported by Dr J G Umstatt, who found that in these colleges "the average of appointments per institution decreased from 107 in 1920-1921 to 69 in 1931-1932, a decrease of 35 per cent." Dr Umstatt expressed his thought that "the problem will become more acute as the surplus of unemployed college teachers increases, and should receive immediate, nation-wide consideration."

Consideration by administrators directly concerned was given at the October 1934 meeting of the Association of American Universities at the University of Chicago ¹⁷

A paper of Prof S H Slichter of Harvard estimated that the drop in academic employment due to the economic depression "has probably been less than 10 per cent," with a shrinkage in the number of professors "much greater in private institutions than in public." Professor Slichter prophesied that "the demand for college and university teachers will increase at a decreasing rate."

Prof George E Carrothers of the University of Michigan gave an estimate that American universities in the ten-year period from 1924 to 1933 awarded "a grand total of approximately 16,721 doctorates of philosophy." To the question "What to do with the product?" Professor Carrothers answered in terms of college teaching and of teaching in secondary schools. Dean L P Eisenhart of Princeton thought it desirable to approximate in the United States what has gone on for years in Europe, where holders of the doctorate and producers of research and literary work are teachers in the lycee and gymnasium. Dean Edgar S Furness of Yale agreed that the secondary schools would gain by taking on doctors of philosophy who have the requisite personal qualifications for teaching younger students, and he suggested also fields such as public service as an outlet for graduate students.

At the same meeting Prof Anton J Carlson of the University of Chicago took definite exception to the doctrine of restricting enrolment because professional fields are crowded. "Is it such a waste if a Ph D, unable to find a place in education or in science, goes into industry or business?" Professor Carlson opposed limitation in the professions, following the old guild custom. "Who are we to say nay to those who want to go ahead regardless of the risks?" Dean Charles B Lipman of the University of California seconded this view, saying that he objected to such limitation, just as he objected to telling a farmer how much he may plant. "We don't know enough about the future to determine now the number of Ph D's it will need." President

Ray Lyman Wilbur of Stanford University added his approval of this point of view.

Limiting Engineering Students — "A more rapid increase than ever before in the quality and number of trained experts and leaders" was predicted in a report published in 1923 by a joint committee of the National Industrial Conference Board and the Society for the Promotion of Engineering Education ¹⁸. This was the committee's answer to the question "Do the industries in the United States need more or fewer engineers than the number now being graduated from engineering schools and colleges?"

Eleven years later (January 1934) a contrary view ¹⁹ was given by Mr David L Fiske, secretary of the American Society of Refrigerating Engineers. Mr Fiske basing his conclusions on an analysis of U S Census figures for forty years declared that "without regard to the employment influences of the current depression, statistics from 1890 to 1930 reveal signs of future overcrowding."

The facts at hand show mainly that in the next two decades the number of men in the profession will probably increase a third over that employed in 1930, if newcomers are limited to those with four years of college training. Professional and educational programs which disregard this situation must assume that the demand for technical engineering services will increase proportionately.

Calling attention to the sharp falling off in enrolment in American engineering schools in the past few years, Prof William B Plank ²⁰ of Lafayette College has written that, so far as the mineral industry is concerned, opportunities for employment appear to be good and that in the near future "the demand may easily exceed the supply."

That the 1923 report of the committee of the National Industrial Conference Board and the Society for the Promotion of Engineering Education remains valid today is maintained by Dean Herman Schneider of the College of Engineering and Commerce, University of Cincinnati. In a recent letter ²¹ Dean Schneider points to "the very wide range of activities covered by the engineer. There is hardly a field of construction, production or distribution in which the engineer has not become the dominant factor." He cites new avenues such as "political science and preventive medicine through the application of sanitary methods, zoning, housing and the employment of engineers by banks holding industrial concerns." Dean Schneider concludes that "there need be no curtailment in the production of engineering graduates who are soundly trained."

Limiting Medical Students — "There should be more effective control over the number and type of practitioners trained." This was one of the nine needs listed by the Committee on the Costs of Medical Care in its 1932 report, to which reference has already been made in this paper.

"It is evident," declared Dr Walter L Bierring of Des Moines, Iowa, in a paper read in September 1933, "that doctors have been trained without any consideration of possible consumer requirements. Overcrowding like overproduction, already existed when the country was consuming the maximum of professional services."

TRENDS IN GRADUATE TEACHING

CHARLES GORDON HEYD, MD

Executive Officer, Department of Surgery, New York Post Graduate
Medical School, Columbia University
NEW YORK

It is indeed a bold spirit who would attempt to prophesy the final objective in graduate medical instruction. There are, however, certain evidences of trends or tendencies that may be evaluated at this time. One given to divination is seldom chastened by his mistaken predictions, and it is reasonably certain that few now here will be present when the final formula is evolved.

In the first decade of the century the majority of men seeking graduate medical instruction were well on into mature life and were seeking to fill the gaps in their medical knowledge. Many were graduates of the hundred medical schools that have ceased to function and the doctor was conscious of two fundamental defects in his training: (a) the lack of preliminary educational qualifications and (b) the inadequacy of his medical training. To his everlasting credit he had the inspirational value of ambition and the desire to extend his usefulness.

With the restriction of the number of medical schools and the development of adequate standards in undergraduate medical schools, the hospitals have become points for the dissemination of graduate medical instruction.

The defect in medical practice today is the lag between scientific knowledge and its practical application. The advancement in scientific knowledge within a period relatively so short as ten years makes it imperative for every physician to bring his practical knowledge into consonance with the present status of scientific medical knowledge. It should be the duty of graduate medical instruction to shorten this gap, to lessen the time interval between discovery, formulation and the practical application. This lag has been taken up by a number of noteworthy endeavors: (1) the efforts of county or state medical societies to bring postgraduate instruction to the county centers, (2) the traveling clinics, (3) the three-day clinics at centers of population by visiting specialists, (4) by staff meetings of hospitals, (5) by means of medical societies and medical publications, and (6) by graduate instruction in connection with established medical schools. The systematic approach to overcoming this medical gap or hiatus will be largely the obligation of universities conducting schools in graduate medical education.

If the medical schools continue to graduate the same number of physicians each year and there is the same annual death rate, there is a constant and increasing accretion of practitioners, as a corollary there will be a constantly diminishing number of patients per physician throughout the population generally. Paralleling the extraordinary industrialization of this country in the last forty years has been the development of specialization and the idea of pure research. Neither the population, the hospital facilities nor the potential economic return can take the yearly output of graduates in medicine and put them all into the specialties or research. Many graduates will engage in one form or other of public health activity, but there will still remain a major proportion of recent graduates in medicine who must be absorbed into the practice of medicine. The history of all social movements indicates that when

the recompense derived from any profession or vocation is on a constantly diminishing scale there is an increasing depreciation in the quality of men entering that profession. It would seem reasonable to anticipate that when the financial return from the practice of medicine becomes relatively too low and the cost of the undergraduate course in medicine too high, the ranks of medical practitioners will be filled with students who desire to make medicine a business or a trade enterprise. The result will be a constantly increasing hospital load of dispensary or clinic practice.

It would indeed be a bold prophet who would attempt to predicate the status of the hospital situation ten years from today. I believe that at least 60 per cent of the practice of medicine in the well populated states of the Union will be undoubtedly taken care of through dispensaries and clinics. It would seem inevitable that the private and voluntary hospital system will undergo remarkable transformation and that physicians serving in dispensaries will undoubtedly be paid for their attendance.

It may be said that in no country in the world is the level of dispensary medical practice equal to that in America. Generally speaking, the medical service provided by the dispensary system is adequate and effective. A survey of the constantly diminishing mortality statistics of the last thirty years offers conclusive proof on this point.

It is apparent that the voluntary hospital system is in the process of breaking down by reason of the inadequacy of funds derived from philanthropic sources and that many of the hospitals will be salvaged by becoming part of the city, state or governmental system. There will arise from this condition of affairs the necessity for the periodic reeducation of a large number of physicians. This may be accomplished by mandatory attendance for set periods of study at graduate schools near the large centers of medical thought and activity. The key to this type of graduate teaching will be the individual hospital of 350 beds that will be complete in all the major departments. There may arise from these conditions a second major issue whereby the voluntary hospitals will employ all their staff on a salary basis and enter into active competition for the medical business of the community. This potential semicommercial hospital system may have pedagogic qualities of high repute for specialistic teaching but will be inadequate in a broad comprehensive scheme of graduate instruction, as the teachers in such institutions will have had little or no experience with actual practice and will be restricted to the patients that come to the outpatient department or enter the wards of the hospital.

Education, whether it is medical or purely scholastic, has an organic growth and necessarily should have a continuing development. The practice of medicine, except for the full time, paid physicians in institutions and those engaged in research under salary, will have an economic background which will be predicated on the economic conditions that surround the public health and medical problem.

There are sufficient medical educational facilities to take care of the country's population for an indefinite period of time. In most of the states of the Union there is an adequacy of hospital beds to take care of the citizens who require hospitalization, although there may be in certain localities an inadequacy for special conditions, such as beds for patients with tuberculosis.

Referring to the "limitation of numbers in the first-rate medical schools," Dr Lee said that "the output of doctors is not running wild in the realm of over-production about which we hear so much."

At the same meeting Dr William Trufant Foster, director of the Pollak Foundation for Economic Research, gave an address strongly advocating group practice, in which he commented on the willingness of "physicians as a body especially family doctors, to risk their lives and to serve suffering mankind without regard to money rewards."²⁴

GENERAL VIEWS REGARDING PROFESSIONAL LIMITATIONS

The "extraordinary growth in the number of students" in the universities of Europe and increasing unemployment in the professions were discussed by Dr Walter M Kotschnig of Geneva at a conference of experts in Geneva in August 1933 (Dr Kotschnig has kindly supplied me with a mimeographed copy of the proceedings of this conference.) He said

In almost every country there is a marked increase in the number of medical and law students. The increase in medical students may perhaps be regarded as one of the consequences of the war, which brought the experience of human suffering home to the younger generation as no other event of the last decades had done. The study of law was often taken up even before the war by those who did not know what to study.

Many took to higher education because they preferred it to continued unemployment.

Dr Kotschnig's declaration was that "the number of people who are fitted by intellect and character for university study is necessarily limited," and he expressed his judgment that the great influx of students has lowered the level within European universities. Dr Kotschnig and others at the Geneva Conference very definitely urged restriction in the number of professional students, favoring a system of vocational guidance by which more youths should be trained as electricians, agriculturists and craftsmen.

A vigorous critic of current plans to restrict the number of professional students in the United States is Prof Harold F Clark of Teachers College, Columbia University. Professor Clark's views were set forth in his book "Economic Theory and Correct Occupational Distribution," published in 1931 and more recently in an article in the *Journal of Educational Sociology* for December 1934. In this article he says

No group can be trusted with the determination of the number of people to be admitted to that group. The history of groups that have had power to determine their numbers offers conclusive evidence that that power will be misused.

The damage caused is not less because plausible excuses are given or even because the protection of society is said to be the cause of the limitation.

Along with physicians, lawyers and engineers, Professor Clark includes dentists and architects and adds "The plumbers, bricklayers and carpenters know that there are too many plumbers, bricklayers and carpenters."

Professor Clark's own proposal is that local and state planning commissions should be organized. "The state commissions will have to combine and set up a national occupational council. This will determine the optimum number of people for each occupation. All the people of course, will have to be used to do all of the work."

Somewhat the same criticism was presented in a conference at the University of Oregon in July 1934

by President George W Frasier of the Colorado State Teachers College.²⁵

We are told that we have too many farmers, too many shoemakers, too many textile workers, too many miners, too many ditch diggers.

If we are to be logical then and follow the advice of the leaders of our professional schools, we would cut down the number of men entering all professions and all occupations.

In fact, this whole line of argument reduces itself to absurdity. If we were to cut down our population by five to twenty million we would then need fewer doctors, nurses, teachers, artisans, factory laborers, miners and laborers.

President Frasier then gave as 'the other side of the question' his view that "we do not have too many doctors in America. Large areas of our country are without adequate medical service. We do not have too many teachers in America."

Our surplus labor must be taken up with social services which can be rendered by teachers, playground experts, doctors, nurses and others who do not produce material things. There is a limit to the number of shoes that can be worn or cars that can be driven. There is no limit to the social services that can be rendered in our changing society.

A PERSONAL VIEW

What I have presented thus far represents material which members of the Committee on Standards of the American Council on Education cooperated in gathering and which the chairman of the committee has assembled and summarized as compactly and objectively as he could.

What follows is not objective but subjective. Other members of the standards committee are in no way responsible for it. This is simply a personal opinion, the thought of one man who puts it forward with full recognition of the difficulties of the problem and with no undue confidence that his opinion is right.

My opinion is based on two assumptions.

The first is that, in the American democracy today, one should accept as basic, in regard to limiting numbers in the professions, the old Benthamite doctrine—the greatest good to the greatest number. One should have in mind less the advantage of the profession and of those in it than the advantage of all the people.

A second assumption is that the good of the people is so peculiarly dependent on the service of the professions that satisfactory conditions within the professions are a matter of public concern. The social welfare of all citizens and the personal welfare of each citizen are bound up with how the lawyer represents us, how the engineer builds the bridges over which we ride, how the college professor teaches our sons and daughters, how the physician averts disease and when we have it, heals us.

With these two assumptions in mind I propose a new approach to the question of limiting numbers in the professions, a question I shall for our purposes here restrict to the medical profession. This is the approach that emphasizes quality rather than quantity.

It might appear that quantity would be the prime consideration in the light of our principle of the greatest good for the greatest number, and that this consideration would indicate for the profession of medicine those mass methods and techniques by which industry and business in the United States have produced and distributed efficiently and cheaply. Within certain bounds this is logical, in fact the medical profession has

²⁵ Proceedings of the Conference on Higher Education, University of Oregon, July 1934, pp. 92-93.

together with such research work as may be accomplished in the undergraduate schools. However, in the training of practitioners the most important desideratum is scientific observation. The ability to observe and record accurately, uninfluenced by personal psychological factors, is very difficult to obtain. For the development of the scientific spirit, which means precision, accuracy of observation and succinct, clear-cut, inductive reasoning, there is no training quite so thorough as the application of one's time and ability to a concrete problem in research. However, relatively few men seeking postgraduate instruction can take this kind of work, either from lack of time, inadequate preliminary education, or the absence of the right spirit or many other undetermined factors.²

Medical graduates seeking instruction will necessarily be varied but may be classified as follows: 1 The recent graduate or hospital intern wishing instruction of a general character and desiring a continuous and advanced form of technic of graduate teaching. 2 The physician desiring to enter a specialty either from general practice or from a general rotating internship. 3 The physician desiring to engage in research work. 4 The physician who can justly claim to be a specialist and who desires more intensive training in some particular phase of his own specialty. 5 The physician already in general practice who desires to renew or keep abreast of the latest scientific advances in medicine. 6 The physician who desires to make good some of his professional deficiencies that have been revealed in his medical practice. This group of physicians is apt to be made up of men doing general practice in communities of from 50,000 to 100,000 and who of necessity must engage in some degree in a type of practice that in larger cities is handled by specialists. 7 A large group of practitioners who live within commuting distance of graduate institutions and who desire to "refresh" their medical information by a day's, a week's or a month's intensive course in some particular phase of medicine. 8 The recent resident or intern who desires to proceed for a higher medical degree, such as doctor of medical science.³

One of the most interesting questions in medical pedagogy—What shall constitute the proper relationship between clinical and laboratory work?—is constantly recurring and engaging the attention of medical educators. With the ever increasing tendency toward specialization, certain functions formerly considered within the domain of clinical medicine are performed by separate departments with individual executive officers. An excellent example of this scheme of division of labor is to be found in the marvelous organization and development of the laboratory courses of study. So marked has this tendency toward specialistic training become that in many clinical laboratories is found an overaccentuation of the laboratory idea with a corresponding diminution, even to the point of extinction, of the clinical phases. This condition brings with it certain particular evils, and, although it is true that there are certain definite benefits to be derived from such an accurate division of labor, the main objection is that the evils far outweigh the supposed benefits. A consideration of the problem in its main features would suggest that the proper course is one midway between the two divergent ideas. A happy medium would be arrived at when the laboratory would

exist in an associated position and when laboratory information is coordinated with the clinical aspects of disease.

The old fashioned, so-called practical physician with little real scientific training is a heritage of obsolete conditions. The present-day demand is for real scientific training and the concrete application of the principles and knowledge of chemistry, physiology, bacteriology and pathology to the conditions of everyday medical practice. It is not necessary to obtain a theoretical and practical knowledge in all the laboratory subjects, nor would the time be well spent, for it would require from five to ten years to obtain such an abundant knowledge. The problem is rather for a moderate knowledge, thoroughly mastered and tested by actual practice.

With the rapid progress medicine is making today the student must make up his mind to pick out from time to time such new phases of medical knowledge as have established for themselves a definite place in everyday practice. The newer aspects of metabolism, endocrinology, serology, x-ray interpretation and roentgen therapy present such functional importance that the alert physician must obtain a thorough, broad understanding of the subject. Therefore, any comprehensive plan of study will require sufficient laboratory work to make the student conversant with the fundamental knowledge necessary for efficient scientific, practical work. This will embrace a knowledge of bacteriology, of chemistry, of the various phenomena of metabolism, of blood chemistry, of the newer aspects of diabetes and nephritis and the like. In pathology, of the various effects of chronic focal infection, of degenerative process from chronic intoxication. In therapeutics, of the use of some of the synthetic remedies and the latest teachings of pharmacology. In technic, of the application of modern diagnostic procedures, of spinal puncture, of intraspinal and intravenous therapy, and an experience in the diagnostic aid of special instruments, such as the ophthalmoscope, the endoscope and the cystoscope.

The undergraduate medical school and the changed relationships in the hospital situation will largely predetermine activities in graduate medical instruction. Pure research probably will be eliminated from undergraduate medical activities, and the function of the faculty in the undergraduate medical schools, so far as research is concerned, will be to select those students who from natural ability and aptitude exhibit qualities that will be valuable in a research program. Pure scientific medical research should be reserved for graduate time. Certain hospitals will undoubtedly devote their clinical material to a complete and integrated system of medical fellowships and resident positions in the special division of medicine. The number of such resident positions will after all be limited, for only a hospital with large bed and clinic facilities can possibly transform itself into an institution for the development of specialists. It will require anywhere from three to five years, added to the undergraduate course in medicine, for an institution to certify to the competence of an individual in a given specialty. The teaching of specialists will of necessity be confined to large cities and their large hospitals.

There follow logically from these premises three distinctive trends in graduate medical education: (1) a research fellowship in pure science, (2) a continuous

³ Bulletin of the New York Post Graduate Medical School and Hospital.

a dean and faculty calls for more care, wisdom and humility. But undertake it they must.

And now for my concluding thought. It seems to me that, if we accept the doctrine of quality first the determination of quality among candidates for the medical profession will be left to the medical colleges. If so, there will probably be a solution of our question as to numbers in the profession—a solution that issues from the economic conditions in which we find ourselves. Financial limitations hamper every university and medical school. With stabilized income from tax sources in institutions under public control with stabilized income from endowments in institutions under private control with stabilized fees in both types the gifts that trickle in should be assigned not for more enrolment but for more research and for improvement in teaching facilities.

Each medical college should resist the temptation to take more students merely to make money. Each medical college should hail quality as its obligation and goal as never before. In this policy there should be concurrence by the Council on Medical Education and Hospitals of the American Medical Association by the Association of American Medical Colleges and by the Federation of State Medical Boards of the United States. This is an objective, I firmly believe that is unselfish and is devised for no private advantage but is calculated rather to bring the greatest good to the greatest number of the American people.

THE HISTORY OF MEDICAL LICENSURE

HENRY E. SIGERIST, MD

William H. Welch Professor of the History of Medicine
The Johns Hopkins University
BALTIMORE

The idea of making the practice of medicine dependent on a license, a certificate issued by a competent body testifying that the bearer has undergone a training considered adequate, is an idea that originated in the Middle Ages. The European Middle Ages created an institution that was modified in the course of time but survived in its basic idea to the present day. The idea of licensing the medical profession resulted from the general structure of medieval society, which was strictly organized according to status, crafts, trades and professions. Each such vocational group had regulations, standard-setting codes, guaranteeing highly qualified services to society. It was recognized that such standards were particularly important in the case of the medical profession. In no other profession is lack of knowledge so serious in its consequences as in medicine. A wrong legal judgment can be corrected by a higher court. A wrong diagnosis or a wrong treatment may result in the death of the patient. No wonder society tried to protect itself from ignorant physicians. If the profession was to be respected and society was to have confidence in it, standards must be set, and the man living up to these standards had to testify legally that he was a real physician. In this way a clean-cut distinction was established between the physician who had undergone a prescribed training and the pseudophysician or quack. Great credit must be given to medieval society not only for having recognized the importance of these facts but for giving them a legal conformation and for having set an example for all time to come.

Read before the Annual Congress on Medical Education Hospitals and Licensure Chicago Feb 18 1935

MEDICAL PRACTICE IN ANCIENT TIMES

Attempts at some kind of regulation of medical practice can be found before the Middle Ages and they will have to be reviewed briefly. The oldest document of the kind that I know of is to be found in the sacred books of the Parsis, the Avesta. In one of these books, the Vendidad, a book very similar in character to Leviticus, is found a tariff regulating the physician's fee, very much like the one in the Code of Hammurabi. Besides, there are rules concerning the admission of the surgeons to practice. The text runs ¹

36(94) Maker of the material world thou Holy One! If a worshipper of Mazda want to practice the art of healing, on whom shall he first prove his skill?—on worshippers of Mazda or on worshippers of the Daevas?—

37(96) Ahura Mazda answered 'On worshippers of the Daevas shall he first prove himself rather than on worshippers of Mazda. If he treat with the knife a worshipper of the Daevas and he die if he treat with the knife a second worshipper of the Daevas and he die if he treat with the knife for the third time a worshipper of the Daevas and he die, he is unfit to practice the art of healing forever and ever.

38(99) Let him therefore never attend any worshipper of Mazda, let him never treat with the knife any worshipper of Mazda, nor wound him with the knife. If he shall ever attend any worshipper of Mazda if he shall ever treat with the knife any worshipper of Mazda and wound him with the knife, he shall pay for it the same penalty as is paid for wilful murder.

39(102) If he treat with the knife a worshipper of the Daevas and he recover if he treat with the knife the second worshipper of the Daevas and he recover if for the third time he treat with the knife a worshipper of the Daevas and he recover, then he is fit to practice the art of healing forever and ever.

40(104) He may henceforth at his will attend worshippers of Mazda, he may at his will treat with the knife worshippers of Mazda, and heal them with the knife.

In other words, parts of society, the true believers, were protected against lack of knowledge in the surgeon.

This is a very exceptional document, for throughout antiquity medical practice was open to all. The physicians had to compete with the quacks, and some of the hippocratic writings show how serious this competition was. Some physicians endeavored to outdo themselves by dressing extravagantly and by displaying showy instruments and it is highly probable that the art of prognostic developed to such an extent in Greece not only for medical reasons but through the tendency to gain the patient's confidence by telling him right away what his case was and what would happen to him.² The hippocratic oath was not a legal document. It was a private contract between master and pupil, the master adopting his pupil as a son. And, besides, it set ethical standards.³ No worldly authority could enforce the oath. It is not known how long it was in effect, in all probability it was restricted to a small group of physicians in the early days of Greece.

In ancient Rome, medical practice was also open to all. But then from the first century B. C. on, the physicians were given a privileged position in society. In 46 B. C., Julius Caesar presented all free-born Greek physicians on Roman soil with the right of Roman citizenship. Augustus knighted his body-physician Musa. In the ensuing years the privileges accorded physicians

teach for some time. Special arrangements had to be made for Jewish physicians who could not be licensed by a representative of the pope in such cases the license was issued by the faculty. Whoever practiced without a license was excommunicated and, in addition, persecuted by the municipal authorities. The license gave a physician the privilege of practicing in all Christian countries. In Paris, the formula spoken by the chancellor when conferring the license was ⁸

Ego, cancellarius, auctoritate apostolica, qua fruor in hac parte, do vobis licentiam legendi, interpretandi et faciendi medicinam hic et ubique terrarum. In nomine Patris, et Filii,

—I, the Chancellor, by the power invested by my apostolic authority that I exercise in these parts, confer on you the faculty to teach, to interpret and to practice medicine here and in all countries. In the name of the Father the Son

When a physician moved to another city, he had to submit to certain formalities. First of all the municipal authorities had to grant him permission to settle down a permission that everybody had to seek, whether he was a physician or not. Then the physician had to present his diplomas to the university of the place and have his privileges renewed. This consisted in the paying of a fee and another disputation, the idea of which was to demonstrate that the candidate not only had degrees but was still conversant in the subject. Endless conflicts resulted if a man did not readily submit to these formalities. History tells of many such cases. Paracelsus in 1527 was invited by the city authorities to practice medicine in Basel and was appointed municipal physician. Being a doctor of the University of Ferrara, he was entitled to lecture at the university but, stubborn as he was, he refused to submit to the required formalities and the result was a permanent hostility of the university toward him, which eventually contributed to his peremptory departure from Basel. Johannes Sambucus, a Hungarian physician practiced in Vienna without having shown his credentials to the faculty, whereupon the faculty in 1567 denounced him to the city authorities, and he would have been expelled from the city had not the emperor Maximilian II interfered.⁹

In cities where there were no universities the physician was compelled to present his diplomas to the city authorities, usually to the board of health. The fact that many, and among them some of the largest cities had no universities led to the establishment of special medical organizations, as for instance the Royal College of Physicians in London, which was granted a charter, Sept 23 1518. It consisted originally of eight persons, and its purpose was to improve and regulate the exercises of the art of physic. No person except a graduate of Oxford or Cambridge was allowed to practice medicine in England unless he had been examined and approved by the president and three members of this college. This example was followed a century later by Scotland. The fact that irregular practitioners intruded in increasing numbers in Scotland made the need for such an institution strongly felt, and an application was made in 1617 to King James I of England for the establishment of a college, according to which the practitioners of medicine in Scotland should be incorporated into a Royal College of Physicians, which was to appoint

seven members to examine all those who intended to practice in Scotland. The exercise of medicine without a diploma of the college was to be made illegal. Although the application was favorably received at the court, the political conditions delayed the founding of the college, but in 1681 a charter was granted to the college. It is interesting to note that the universities, the municipal corporations and even the bishops and archbishops opposed the founding of the college violently as they considered this an intrusion into their own rights and privileges. While so far the universities had been the only licensing bodies, from then on, in England and Scotland, licenses were granted by medical organizations, i.e., by medical practitioners.

The medieval university was a powerful, well organized body which not only transmitted knowledge but considered it its duty to keep the traditions pure. It was fully aware of its responsibilities, and the license issued by a faculty of medicine was a full guaranty of the adequate knowledge of its bearer. In the centuries following the Renaissance, the universities lost their high standing. They did not follow the trend of the times. They clung to the old traditions. A new medical science developed, and it developed outside the universities, centering its efforts around the new academies. In the Middle Ages most universities were controlled by the church, and this guaranteed equal standards. After the Reformation the conditions were greatly changed. The church lost its grip on many of the universities, and there was a marked tendency toward state interference in university matters. In the seventeenth and eighteenth centuries the standard of the universities became more and more unequal. While some of the universities were still conscientious in delivering degrees, others became lax. A degree of such a university was therefore no longer a guaranty of a graduate's fitness to practice medicine, and the states began to protect themselves by disregarding the academic degree.

LICENSURE IN PRUSSIA

Until 1725, whoever had a master's degree of a medical faculty could practice medicine in Prussia, and whoever had a master's patent of a surgeon's guild could practice surgery. In 1725, however, a bill was passed according to which the master of medicine could not exercise his profession before he had taken a course in anatomy and discussed a *casus medico-practicus* before the *collegium medicum* and the *medico-chirurgicum*, which was a state board of health.¹⁰ The right of licensure was therefore taken from the universities and assumed by the state. New regulations were passed in 1789 and 1791, the candidate was examined "in the most important subjects of medicine." In other words, he now had to take two examinations, one for his doctor's degree at the university and, in addition, one for the license before a state board. After the unification of Germany, the license obtained in one of the states gave the privilege of practicing in all the other states, and it was decided that the state examination should be given by the physicians most competent in the matter, namely, by the university professors of the medical faculties. In this way one avoided submitting the candidates to two examinations, which would be a mere repetition and a waste of time, the doctor's degree was conferred after the candidate had passed his state examination and had submitted an inaugural dissertation. The universities had been reorganized in the

HOSPITALS BY SIZE

No phenomenon regarding hospitals is more striking than the decline in the number of small hospitals and the corresponding increase in the number of large hospitals during the past decade

Hospitals by Size 1924-1934

Year	Under 10 Beds	10-25	26-50	51-100	101-200	201-300	300 Beds	Over 300 Beds	Total
1924	665	2,301	1,744	1,207	740	260	451	7,320	
1928	325	2,129	1,586	1,240	765	311	489	6,865	
1934	191	1,661	1,485	1,215	841	361	580	6,334	

During that time, hospitals of less than ten beds declined in number from 665 to 191, ten to twenty-five beds from 2,301 to 1,661, twenty-six to fifty beds from 1,744 to 1,485. Only in the size group of fifty-one to a hundred beds capacity did the number of hospitals

remain practically stationary for the ten year period having increased only from 1,207 to 1,215. Hospitals of from 101 to 200 beds capacity increased in number from 746 to 841, 201 to 300 beds from 256 to 361, and over 300 beds from 451 to 580.

PATHOLOGY DEPARTMENTS

The census of hospitals for the year 1929 revealed that 4,026 of the 6,665 hospitals then in existence had clinical laboratories. In 1933, 4,324 of the 6,437 hospitals then in existence had their own laboratories. In 1934, 4,271 of the 6,334 hospitals reported laboratories. The percentages of hospitals thus equipped are 60.41, 67.17 and 67.43 for the three years respectively.

In 1934, 2,950 hospitals, or 46.57 per cent of the total hospitals in existence, reported having physicians as pathologists or laboratory directors as compared with 2,878 or 44.71 per cent in 1933.

At present 876 hospitals report that laboratory work is in charge of other than physician-pathologists, as compared with 1,089 one year ago. Hospitals in the United States employ 6,105 laboratory technicians.

RADIOLOGY DEPARTMENTS

In 1929, 4,394, or 65.93 per cent of hospitals then in existence reported that they had their own radiology

TRENDS IN GRADUATE TEACHING

CHARLES GORDON HEYD, M.D.

Executive Officer, Department of Surgery, New York Post Graduate
Medical School, Columbia University,
NEW YORK

It is indeed a bold spirit who would attempt to prophesy the final objective in graduate medical instruction. There are, however, certain evidences of trends or tendencies that may be evaluated at this time. One given to divination is seldom chagrined by his mistaken predictions, and it is reasonably certain that few now here will be present when the final formula is evolved.

In the first decade of the century the majority of men seeking graduate medical instruction were well on into mature life and were seeking to fill the gaps in their medical knowledge. Many were graduates of the hundred medical schools that have ceased to function and the doctor was conscious of two fundamental defects in his training: (a) the lack of preliminary educational qualifications and (b) the inadequacy of his medical training. To his everlasting credit he had the inspirational value of ambition and the desire to extend his usefulness.

With the restriction of the number of medical schools and the development of adequate standards in undergraduate medical schools the hospitals have become points for the dissemination of graduate medical instruction.

The defect in medical practice today is the lag between scientific knowledge and its practical application. The advancement in scientific knowledge within a period relatively so short as ten years makes it imperative for every physician to bring his practical knowledge into consonance with the present status of scientific medical knowledge. It should be the duty of graduate medical instruction to shorten this gap, to lessen the time interval between discovery, formulation and the practical application. This lag has been taken up by a number of noteworthy endeavors: (1) the efforts of county or state medical societies to bring postgraduate instruction to the county centers, (2) the traveling clinics, (3) the three-day clinics at centers of population by visiting specialists, (4) by staff meetings of hospitals, (5) by means of medical societies and medical publications, and (6) by graduate instruction in connection with established medical schools. The systematic approach to overcoming this medical gap or hiatus will be largely the obligation of universities conducting schools in graduate medical education.

If the medical schools continue to graduate the same number of physicians each year and there is the same annual death rate, there is a constant and increasing accretion of practitioners, as a corollary there will be a constantly diminishing number of patients per physician throughout the population generally. Paralleling the extraordinary industrialization of this country in the last forty years has been the development of specialism and the idea of pure research. Neither the population, the hospital facilities nor the potential economic return can take the yearly output of graduates in medicine and put them all into the specialties or research. Many graduates will engage in one form or other of public health activity, but there will still remain a major proportion of recent graduates in medicine who must be absorbed into the practice of medicine. The history of all social movements indicates that when

the recompense derived from any profession or vocation is on a constantly diminishing scale there is an increasing depreciation in the quality of men entering that profession. It would seem reasonable to anticipate that when the financial return from the practice of medicine becomes relatively too low and the cost of the undergraduate course in medicine too high, the ranks of medical practitioners will be filled with students who desire to make medicine a business or a trade enterprise. The result will be a constantly increasing hospital load of dispensary or clinic practice.

It would indeed be a bold prophet who would attempt to predicate the status of the hospital situation ten years from today. I believe that at least 60 per cent of the practice of medicine in the well populated states of the Union will be undoubtedly taken care of through dispensaries and clinics. It would seem inevitable that the private and voluntary hospital system will undergo remarkable transformation and that physicians serving in dispensaries will undoubtedly be paid for their attendance.

It may be said that in no country in the world is the level of dispensary medical practice equal to that in America. Generally speaking, the medical service provided by the dispensary system is adequate and effective. A survey of the constantly diminishing mortality statistics of the last thirty years offers conclusive proof on this point.

It is apparent that the voluntary hospital system is in the process of breaking down by reason of the inadequacy of funds derived from philanthropic sources and that many of the hospitals will be salvaged by becoming part of the city, state or governmental system. There will arise from this condition of affairs the necessity for the periodic reeducation of a large number of physicians. This may be accomplished by mandatory attendance for set periods of study at graduate schools near the large centers of medical thought and activity. The key to this type of graduate teaching will be the individual hospital of 350 beds that will be complete in all the major departments. There may arise from these conditions a second major issue whereby the voluntary hospitals will employ all their staff on a salary basis and enter into active competition for the medical business of the community. This potential semicommercial hospital system may have pedagogic qualities of high repute for specialistic teaching but will be inadequate in a broad comprehensive scheme of graduate instruction, as the teachers in such institutions will have had little or no experience with actual practice and will be restricted to the patients that come to the outpatient department or enter the wards of the hospital.

Education, whether it is medical or purely scholastic, has an organic growth and necessarily should have a continuing development. The practice of medicine, except for the full time, paid physicians in institutions and those engaged in research under salary, will have an economic background which will be predicated on the economic conditions that surround the public health and medical problem.

There are sufficient medical educational facilities to take care of the country's population for an indefinite period of time. In most of the states of the Union there is an adequacy of hospital beds to take care of the citizens who require hospitalization, although there may be in certain localities an inadequacy for special conditions such as beds for patients with tuberculosis.

OUTPATIENT DEPARTMENTS

Outpatient statistics presented in an accompanying table give the total number of outpatient departments by states operated during the year 1934 as 2,319. There

were 2,351 reported in 1933. The total number of patients this year was 9,885,465, compared to 9,519,427 in 1933. The total number of visits made by out-

patients during the year was 34,358,606. The number of visits in 1933 was 32,822,077.

The table is arranged so that comparisons are readily made between the figures for recent years.

Along with the increase of 1,536,529 visits to outpatient departments in the last year, it is interesting to note that the number of patient days for bed patients in all hospitals amounted to 302,985,770.

During the past year the number of visits to outpatient departments in the state of New York rose from 7,743,191 to 8,238,764. For Illinois, the visits dropped from 2,772,437 to 1,536,982.

* Including all registered general hospitals except army, navy, marine and veterans.

METHODS OF REGISTERING AND APPROVING HOSPITALS

The inclusion of any hospital in the Register is an indication that evidence concerning irregular or unsafe practices in that hospital has not been available to the Council on Medical Education and Hospitals. Con-

together with such research work as may be accomplished in the undergraduate schools. However, in the training of practitioners the most important desideratum is scientific observation. The ability to observe and record accurately, uninfluenced by personal psychological factors, is very difficult to obtain. For the development of the scientific spirit, which means precision, accuracy of observation and succinct, clear-cut, inductive reasoning, there is no training quite so thorough as the application of one's time and ability to a concrete problem in research. However, relatively few men seeking postgraduate instruction can take this kind of work, either from lack of time, inadequate preliminary education, or the absence of the right spirit or many other undetermined factors.³

Medical graduates seeking instruction will necessarily be varied but may be classified as follows: 1 The recent graduate or hospital intern wishing instruction of a general character and desiring a continuous and advanced form of technique of graduate teaching. 2 The physician desiring to enter a specialty either from general practice or from a general rotating internship. 3 The physician desiring to engage in research work. 4 The physician who can justly claim to be a specialist and who desires more intensive training in some particular phase of his own specialty. 5 The physician already in general practice who desires to renew or keep abreast of the latest scientific advances in medicine. 6 The physician who desires to make good some of his professional deficiencies that have been revealed in his medical practice. This group of physicians is apt to be made up of men doing general practice in communities of from 50,000 to 100,000 and who of necessity must engage in some degree in a type of practice that in larger cities is handled by specialists. 7 A large group of practitioners who live within commuting distance of graduate institutions and who desire to "refresh" their medical information by a day's, a week's or a month's intensive course in some particular phase of medicine. 8 The recent resident or intern who desires to proceed for a higher medical degree, such as doctor of medical science.³

One of the most interesting questions in medical pedagogy—What shall constitute the proper relationship between clinical and laboratory work?²—is constantly recurring and engaging the attention of medical educators. With the ever increasing tendency toward specialism, certain functions formerly considered within the domain of clinical medicine are performed by separate departments with individual executive officers. An excellent example of this scheme of division of labor is to be found in the marvelous organization and development of the laboratory courses of study. So marked has this tendency toward specialistic training become that in many clinical laboratories is found an overaccentuation of the laboratory idea with a corresponding diminution, even to the point of extinction, of the clinical phases. This condition brings with it certain particular evils, and, although it is true that there are certain definite benefits to be derived from such an accurate division of labor, the main objection is that the evils far outweigh the supposed benefits. A consideration of the problem in its main features would suggest that the proper course is one midway between the two divergent ideas. A happy medium would be arrived at when the laboratory would

exist in an associated position and when laboratory information is coordinated with the clinical aspects of disease.

The old fashioned, so-called practical physician with little real scientific training is a heritage of obsolete conditions. The present-day demand is for real scientific training and the concrete application of the principles and knowledge of chemistry, physiology, bacteriology and pathology to the conditions of everyday medical practice. It is not necessary to obtain a theoretical and practical knowledge in all the laboratory subjects, nor would the time be well spent, for it would require from five to ten years to obtain such an abundant knowledge. The problem is rather for a moderate knowledge, thoroughly mastered and tested by actual practice.

With the rapid progress medicine is making today the student must make up his mind to pick out from time to time such new phases of medical knowledge as have established for themselves a definite place in everyday practice. The newer aspects of metabolism, endocrinology, serology, x-ray interpretation and roentgen therapy present such functional importance that the alert physician must obtain a thorough, broad understanding of the subject. Therefore, any comprehensive plan of study will require sufficient laboratory work to make the student conversant with the fundamental knowledge necessary for efficient scientific, practical work. This will embrace a knowledge of bacteriology, of chemistry, of the various phenomena of metabolism, of blood chemistry, of the newer aspects of diabetes and nephritis and the like. In pathology, of the various effects of chronic focal infection, of degenerative process from chronic intoxication. In therapeutics, of the use of some of the synthetic remedies and the latest teachings of pharmacology. In technique, of the application of modern diagnostic procedures, of spinal puncture, of intraspinal and intravenous therapy, and an experience in the diagnostic aid of special instruments, such as the ophthalmoscope, the endoscope and the cystoscope.

The undergraduate medical school and the changed relationships in the hospital situation will largely predetermine activities in graduate medical instruction. Pure research probably will be eliminated from undergraduate medical activities, and the function of the faculty in the undergraduate medical schools, so far as research is concerned, will be to select those students who from natural ability and aptitude exhibit qualities that will be valuable in a research program. Pure scientific medical research should be reserved for graduate time. Certain hospitals will undoubtedly devote their clinical material to a complete and integrated system of medical fellowships and resident positions in the special division of medicine. The number of such resident positions will after all be limited, for only a hospital with large bed and clinic facilities can possibly transform itself into an institution for the development of specialists. It will require anywhere from three to five years, added to the undergraduate course in medicine, for an institution to certify to the competence of an individual in a given specialty. The teaching of specialists will of necessity be confined to large cities and their large hospitals.

There follow logically from these premises three distinctive trends in graduate medical education: (1) a research fellowship in pure science, (2) a continuous

³ Bulletin of the New York Post Graduate Medical School and Hospital.

boarding places for tuberculous patients. Some of these places will, with the growth of population, develop into hospitals.

The capacity of these auxiliary types of places is unknown and hardly ascertainable. Our survey of hospitals has noted 1,535 of them. They constitute an important factor in medical and nursing care for certain districts, and as adjuncts to medical service.

SURVEY OF TUBERCULOSIS HOSPITALS

A plan for the study of all tuberculosis hospitals was adopted by the Council on Medical Education and Hospitals Oct. 22, 1932, and by the House of Delegates of the American Medical Association in June 1933. The survey, which was planned to cover the original list of 500 tuberculosis sanatoriums, was extended to include children's preventoriums, hospitals for extrapulmonary tuberculosis and the large tuberculosis departments in hospitals of other classifications.

The National Tuberculosis Association and the American Sanatorium Association have extended their full cooperation. At the convention of the National Tuberculosis Association in Cincinnati in May 1934 the officials of these organizations offered their assistance in the preparation of the tuberculosis questionnaire. Subsequently, many of the sanatorium superintendents contributed valuable suggestions.

The inspection work, which was carried out by the Council's staff of hospital examiners began in the spring of 1933 and was carried out in conjunction with the Council's investigation of other hospitals. Toward the end of the survey a questionnaire was sent to all sanatoriums in order to record changes and further supplement the information obtained by inspection. The inspections are now practically completed and it is also gratifying to report that more than 90 per cent of the hospitals have returned the tuberculosis questionnaire.

To gain further knowledge of the extent of tuberculosis hospitalization in the United States, the Council requested 6,117 additional hospitals to report the number of tuberculous patients admitted last year and the number now under treatment. Approximately 5,800 hospitals have reported to date.

At the Annual Congress on Medical Education and Licensure held in Chicago February 18 and 19 a program was included on the general and educational aspects of tuberculosis. One of the papers dealt with

"The Function of the General Hospital in the Treatment of Tuberculosis."

It is expected that the tuberculosis survey will be completed by April 15 of this year and that a preliminary report can be made to the House of Delegates at the annual session of the American Medical Association in June. The results of the study will be made available also to the national tuberculosis organizations, the hospital field and to the medical profession at large.

INSPECTION OF SCHOOLS FOR TECHNICIANS

During recent years the Council on Medical Education and Hospitals has engaged in the study of schools for occupational therapists, laboratory technicians and physical therapy technicians. This was in response to requests of the American Occupational Therapy Association, the American Society of Clinical Pathologists and the American Physiotherapy Association, and by order of the House of Delegates of the American Medical Association.

The work of the Council is concerned with the education of technicians, their registration being in the hands of their own organizations.

1 Schools of Occupational Therapy—The inspection of these schools, which began Nov. 27, 1933, was carried out in conjunction with the other activities of the Council, the schools being inspected by members of the staff on their regular tours among hospitals. Up to the present time, twelve schools have been visited.

Inspection included a study of the organization, faculty, physical plant, resources, administration, publicity, and a detailed study of the curriculum.

Essentials of an acceptable school of occupational therapy are being set up in cooperation with officials of the American Occupational Therapy Association. When these essentials are finally approved by the House of Delegates, a list of acceptable schools will be prepared.

2 Schools for Clinical Laboratory Technicians—The Council began inspecting these schools in 1933 together with its regular hospital field work. The Council's study covers organization, faculty, physical plant, records, educational requirements, curriculum, advertising, and all other matters having any bearing on the operation of the school.

Of the 215 schools reported to be in operation, 112 have already been inspected. When the survey has been completed the Council in conference with others will make the necessary changes in the existing educational standards. Following the approval of the essentials, a list of schools offering acceptable training in clinical laboratory technique will be prepared.

3 Schools for Physical Therapy Technicians—The Council on Physical Therapy and the Council on Medical Education and Hospitals of the American Medical Association have been lending their cooperation to the Congress on Physical Therapy in the formulation of proper standards for the Registry of Physical Therapy Technicians.

The Board of Trustees of the American Medical Association in 1934 was directed to effect, if feasible, some plan for rating schools for physical therapy technicians. The Trustees passed the matter on to the Council on Medical Education and Hospitals.

The Council has inspected thirty out of the forty-three existing schools. On the completion of this survey, the Council together with the representatives of the American Physiotherapy Association, the Congress on Physical Therapy and the Council on Physical Therapy will formulate proper educational requirements and essentials for approved schools of physical therapy. When these essentials are approved by the House of Delegates of the American Medical Association, a list of approved schools for physical therapy technicians will be prepared.

PRACTICAL CONSIDERATIONS RELATING TO INTERNSHIPS AND RESIDENCIES

Advice or information is often sought of the Council on many matters affecting intern or residency training not essentially educational in substance. The inquiries most frequently made relate to: 1. The present supply and demand for interns. 2. Preferred methods of appointment of interns. 3. Proper appraisal of intern and residency services, particularly the kind of records that should be kept. 4. Salaries for interns.

Variation in custom and other local circumstances makes it inadvisable to present any single method or

Hahnemann Medical College and Hospital of Philadelphia
Johns Hopkins University School of Medicine
University of Maryland School of Medicine and College of
Physicians and Surgeons
George Washington University School of Medicine
Howard University College of Medicine
Georgetown University School of Medicine

From the studies thus far conducted it is apparent that some schools are accepting more students than the circumstances justify. In some instances physical or clinical facilities are inadequate, and in some instances many students are admitted whose academic records are poor.

THE SITUATION IN VARIOUS DEPARTMENTS

Psychiatry—Few schools, if any, have reached the level in the teaching of psychiatry recommended by the National Committee for Mental Hygiene. Dr. Ebaugh of that committee, in his paper before the Association of American Medical Colleges, at Nashville in October 1934, reported recent improvement in more than a score of medical schools in this respect. Many schools, however, still rely on the old-fashioned method of taking senior students to a state hospital for a three ring circus with human performers. The training of students in an understanding of the mental factors that may be present in the ordinary run of medical cases has not as yet progressed very far. It will take courage and fresh attacks on the problem to make the mental state of patients as significant to the medical student as physical phenomena.

Public Health—Dr. Osler used to say that, when a score of remedies are used for one disease, it is likely that none of them have much value. A wide variation in the methods employed for the teaching of what is called public health would seem to indicate that this part of the medical curriculum is still in an experimental stage. Some schools lay great stress on the functions of the public health official. This would seem to me a specialty that should be reserved for graduate study. Some schools stress what they call the preventive aspects of general medicine and surgery, but actual accomplishment along this line is still disappointing and will continue so until public health teaching of the prospective physician becomes a substantial part of the medical course. More support for public health teaching in the medical school is needed if full advantage of known facts is to be given the public.

Obstetrics—The report of the Committee on Maternal Mortality of the New York Academy of Medicine, released about a year ago, severely arraigned the teaching of obstetrics in medical schools. Many of the conclusions of that committee rest on false or insecure premises, but the studies so far made by the Council do indicate that in some schools the training in obstetrics is definitely inadequate. In some cases the teaching is almost exclusively didactic, and clinical experience falls far short of the standards set by the Council. In other instances, the students may participate in a fair number of deliveries but without adequate supervision or any supervision at all.

So far, the inspections have shown a remarkable strength in the basic sciences and main clinical departments of most schools. One may well be proud of the results of thirty years of the combined efforts of physicians, educators and laymen, together with foundations, universities and hospitals. But the Council's pride in achievement should stimulate it to work for fully rounded results in all schools in all parts of the country.

SPECIAL EXAMINING BOARDS

During the year the Council has been studying the relationships of the specialties to special examining boards. Certain parts of these relationships will require study and careful analysis before final plans are adopted. The boards have been set up or are being organized by leaders and leading organizations in the specialties. The Council, representing the general profession, has certain responsibilities to the profession and to the public that demand a decisive part in any special recognition given to specialists. It has to be on guard to see that there is free access by all properly equipped and trained men and women to the specialties. There is always danger of "shut-out" organizations developing, similar to fraternities and some of the present national societies of specialists. Those who have arrived are often human enough to set up unfair and even personal obstacles to prevent competitors from getting in. The Council on Medical Education and Hospitals of the American Medical Association must take a fair attitude to all and an uncompromising attitude against either favoritism or prejudice.

Some of the difficulties now being encountered are

1 Most of these special boards have adopted the statement that the applicant must be "a graduate of a medical school which is satisfactory to the board."

Since it is known how difficult it is for the Council to make an appraisal of medical schools, it must be evident that these special boards have no satisfactory means of knowing the character of the medical school except by relying on the Council's published list. If so, why not accept the fact and require graduation from a medical school approved by the Council?

2 Some of these boards require the candidate to have limited his practice and to indicate that he intends to continue to limit his practice to the special field involved.

It seems to me that such a requirement may operate to the detriment of the specialty concerned. Suppose that a well trained man, in radiology for example, should desire to locate in a city of 50,000. For the first two or three years he might find it quite impossible to maintain himself in a practice limited to radiology, and during these introductory years he might desire to do a little general practice just to keep the pot boiling. It is almost certain that a well trained man would prefer to restrict himself to radiology just as soon as it would be economically feasible, to enforce the limitation might prevent, in the case cited, a well trained man from locating in such a town.

3 This limitation is particularly difficult with respect to obstetrics and gynecology. From a physiologic point of view, these specialties deal with the female reproductive system, but in surgical practice an arbitrary line cannot be drawn between the reproductive organs and other contents of the abdominal cavity. These special boards should face the facts and should not ensnare the medical profession in a web of fine spun theory.

4 The procedure of refusing a certificate or examination should be modified. One of the present boards requires its candidates to sign a waiver of rights. Should the council not require that, whenever an applicant is refused a certificate or admission to the examination, the board should allow the rejected candidate some recourse.

employed and to submit this information to the American Medical Association annually on special forms supplied for this purpose

The essential part of such a record system might well be the application blank itself. Data supplied by the candidate should be verified by direct correspondence with the medical school, a step already taken by the majority of institutions. Notations should also be made on the same blank to indicate when the internship or residency commenced and when it terminated and the date when this information was forwarded to the American Medical Association.

Many hospitals have extended this system to include periodic evaluations of the type of instruction and experience received by interns and residents, and also to receive at regular intervals from heads of clinical departments an appraisal of the service rendered, aptitude displayed and general attitude of each member of the house staff.

In the registration of credit in the files of the American Medical Association, most difficulty arises either from lack of agreement as to what constitutes an internship, externship or residency, or conflicting dates of duration of services. Both of these factors require an increasingly voluminous verifying correspondence. It is strongly hoped that in the near future uniform methods of designating the various gradations of house officers may be adopted throughout the hospital world, possibly according to the following definitions.

An intern is one who has been granted an M.B. or M.D. degree from an approved medical school, and, whether still enrolled in the medical school or not, enters a hospital shortly after graduation for at least twelve months of supervised clinical experience. Depending on the length of the internship, the service may be divided into junior, senior and intermediary grades, and, according to type, rotating, mixed or straight.

A resident has completed an approved internship and elects to continue for at least twelve months in a hospital in order to obtain an adequately supervised experience in a limited field of medicine or surgery. A

Allowances for Interns in Approved Hospitals

	Number of Hospitals				Number of Interns			
	1923	1927	1930	1933	1923	1927	1930	1933
Instruction and experience only	190	184	159	203	1 660	2 541	2,842	3 214
Monthly allowance up to \$20	151	201	228	121	907	1 446	1 633	1 102
\$25 and over	113	150	102	282	394	773	804	1,344
Bonus	6	24	67	59	24	150	570	450

Totals	510	578	664	676	3 119	4 952	6 124	6 204

residency may extend for as long as a progressive, graded service is offered, and provides for junior, assistant and chief residencies.

Clinical fellowships are distinguished from residencies as being extended periods of graduate study, under university control, which are provided for by endowment or other financial arrangement. They usually, though not always, involve the performance of original investigative work and frequently the fulfillment of definite requirements for advanced degrees.

The terms extern, houseman, wardman, and the like, have either outlived their usefulness or add unnecessary confusion to a system organized on such essentially simple lines as most house staffs are.

INTERN SALARIES

Data regarding salaries paid interns in approved hospitals have been presented in this number of THE JOURNAL from time to time. The accompanying table represents latest available statistics. Figures for a few other years are added for comparison. There has been no change in trends apparent in previous years. Although fewer interns than ever are paid, those hospitals which do grant allowances have become somewhat more generous.

Residency Statistics

Number of approved residences 1933	2 133
Number of approved residences 1934	2,378
Number of hospitals approved for residences 1933	340
Number of hospitals approved for residences 1934	377

Metabolic diseases	3	Tuberculosis	143
Mixed	23	Urology	58
Neurology	33		
Neurosurgery	0	Total	2,373

A comparison was made of current practices in governmental and private hospitals. No great difference was noted and in either case the larger the hospital, the more frequently are interns expected to consider that maintenance and instruction are the sole remuneration to which they are entitled.

The Council has neither objected to nor recommended paying interns, since up to the present it has always appeared most satisfactory to leave this question for individual solution by the hospitals according to the excellence and consequent demand for the internships.

COMPUTATION OF NECROPSIES

As reported previously, a change has been made in the Council's method of necropsy computation. All bodies removed from hospitals by coroners or medical examiners, and hence not available for examination in the presence of the interns, may be disregarded as hospital deaths. This ruling will affect also those bodies removed from hospitals and directed to medical schools for dissection. In this way, hospitals are not penalized because of official practices over which they have no control.

It will be remembered that the Council has for some years disregarded stillbirths either as deaths or as necropsies. Except as stated, all other deaths and necropsies should be counted.

RESIDENCY APPROVAL

An increasing number of hospitals are realizing the advantages of supplying postgraduate medical education on an approved basis. The statistical table indicates growth in this field during 1933-1934. The number of available opportunities in the various special classifications is also presented in the table. If additional hospitals feel qualified to supply residencies under any of these headings, copies of the requirements and application blanks may be had on request. Approval, it should be noted, is extended only to individual residencies that have undergone individual analysis and investigation.

DESENSITIZATION

In nearly all the cases desensitization was accomplished and no general reaction was encountered in the process of desensitization. To accomplish desensitization two methods, previously reported, were used. The first and more simple procedure was attempted in the presence of marked bleeding symptoms and the second when the first failed or when the local reactions were too severe. With the first method the injection after the reaction of hypersensitivity was decreased to 0.05 cc of the 1:3,000 solution. This usually caused a swelling but unless it was very large it was disregarded, and subsequent injections were increased in amount, very cautiously, until the required dosage was reached. Occasionally the reactions were too severe or desensitization could not be accomplished, the second method was then indicated. The following series of injections, given twice a week, was found very satisfactory: 0.1 cc of 1:10,000, 0.4 cc of 1:10,000, 0.2 cc of 1:6,000, 0.4 cc of 1:6,000, 0.1 cc of 1:3,000, 0.4 cc of 1:3,000, and so on. Injections were continued even though some of the doses caused a local reaction. In a very few instances the initial dilution had to be decreased, below the 1:10,000 strength. In the great majority of the cases the first method proved efficacious and saved a great deal of time.

It must be remembered that, when sensitivity develops and the dosage is decreased, the hemorrhagic symptoms usually tend to recur. It is therefore essential for the period of desensitization to be as brief as possible, which is another advantage of the first method. An important point is that in cases with marked bleeding symptoms enough venom must be given in the first ten days, before sensitization develops, to tide the patient over the period of desensitization.

EFFECT OF THE ADMINISTRATION OF SNAKE VENOM
IN VARIOUS HEMORRHAGIC CONDITIONS

The patients under treatment could be divided into two main groups. In the first group the hemorrhagic symptoms were not the result of a demonstrable hematologic condition. Many were diagnosed as functional bleeding for lack of a better term. The hemorrhage was due to some local cause, possibly vascular, or as a result of some obscure endocrine disturbance, especially in women. The second group presented definite changes in the blood which were responsible for the hemorrhagic state, as in hemophilia, thrombocytopenic purpura, and sprue.

A Cases Without Blood Changes—1 Idiopathic Nasal Bleeding and Bronchiectasis with Hemoptysis

CASE 1—C. G., aged 3 years, had been bleeding from the lips and gums for a number of months. A sister had a tendency to bleed. There was a slight secondary anemia, the platelets numbering 190,000. After four injections of 0.6 cc. of snake venom given twice a week, the bleeding stopped.

CASE 2—C. H., a girl, aged 10 years, had a history of nasal bleeding, especially on slight trauma. When a tooth was extracted during the period of observation, she bled for two hours. The blood count, bleeding time and coagulation time were normal. Venom was given twice a week, beginning Feb. 27, 1933. There have been no nasal hemorrhages since the first few injections.

CASE 3—H. D., a boy, aged 7 years, had been bleeding from the nose and mouth for four years about three times a week. His oldest brother used to bleed from the nose. Examination of the blood was negative. The patient was treated twice a week from Sept. 2, 1932, until March 4, 1933. Through September there was practically no bleeding. In October he became sensitized. The injections were continued and desensi-

tization was accomplished. There was no nasal bleeding during October and November. He was then told to stay away for two weeks and at the end of that time he had a small nasal hemorrhage. Injections were given once a week and the bleeding stopped. An acute rhinitis caused bleeding a few times, when this subsided, injections were given once every two weeks. There has been no bleeding in the past five months.

CASE 4—Dr. J., aged 28, had had epistaxis off and on for a number of years. Two weeks before injections were given there were daily hemorrhages. Four injections were given. Bleeding stopped after the first injection and there has been no recurrence for eight months.

CASE 5—R. B., aged 17, had had frequent and prolonged nasal bleeding for the last six months. Two weeks before treatment was started the patient suffered daily nasal hemorrhages. Treatment was begun, Feb. 19, 1932, injections were made once a week for two months. After the first injection bleeding stopped, and there has been no recurrence for one year.

CASE 6—J. B., a man, aged 35, had hemoptysis, which had begun fourteen years before. Bleeding occurred once a week or oftener. Usually the patient coughed up about an ounce of blood. Several years after the onset he contracted pneumonia, which was followed by profuse sputum and increased hemoptysis. After a very profuse hemorrhage in April 1930 he was admitted to the Mount Sinai Hospital. The bronchoscopy was negative and the injection of iodized poppy-seed oil showed a few small saccular dilatations in the right upper bronchus. Pneumothorax and phrenicectomy helped for a while. The cause of the hemoptysis was thought to be either a varix of the mucous membranes or a broncholith with ulceration. Since May 1932, bleeding has recurred as much as half a cupful a day. Then it subsided somewhat, but since February 1933 bleeding had almost reached its former severity. It was then decided to treat the patient with injections of snake venom, which was started, Feb. 20, 1933, twice a week. On March 14, 1933, the patient was sensitized and then desensitized. There was no appreciable effect until March 17, when he reported not only that there was less bleeding but that the interval between hemorrhages became lengthened. Injections were continued twice a week. No large hemorrhages have occurred. The patient still coughs up some blood-tinged sputum.

CASE 7—A. H., aged 13 years, admitted to Mount Sinai Hospital, March 30, 1933, complained of attacks of profuse hemoptysis. Tonsillectomy, performed seven years previously, was followed by severe hemorrhages. Two weeks later a cough developed, which continued for five years. Two years later another tonsillectomy was done, this was followed by a cough, accompanied by profuse and foul sputum. Roentgenograms of the chest after the injection of iodized oil showed bronchiectases of the lower left bronchus. Treatment with snake venom was begun in April. There have been no attacks of hemoptysis since the first injection but the patient still coughs up considerable sputum daily. The treatment was first given twice a week and later once a week.

The effect of snake venom injections was striking in seven cases characterized by persistent nasal hemorrhages and occasional bleeding from the lips and the gums, and in two cases of bronchiectasis with persistent hemoptysis. These patients at first were treated with snake venom twice a week and later once a week. In some instances bleeding did not recur after the first few injections. In most of the cases the bleeding did not recur for months after the treatment was discontinued.

2 Functional Uterine Bleeding. The following seven cases were characterized by excessive menstrual periods with no apparent organic abnormalities.

CASE 8—R. A., a woman, aged 28, had secondary anemia—hemoglobin, 68 per cent. The patient had profuse menstrual periods that lasted seven days. Treatment was begun Feb. 6, 1933 and was given twice a week. The next period lasted five days. The patient was sensitized, March 20, and desensitized by April 1. The treatment was continued twice a week. Subsequent periods were shortened, with little bleeding.

treated since Feb 15, 1932. Six weeks after injections were begun, ecchymosis developed at the injection site. She was treated twice a week for five months and after that once a week irregularly. At the last examination, April 7, 1933, she was still getting purpuric spots on the arms and legs. So far, there has been no response to the venom.

CASE 20—S J, a woman, aged 30, with Schönlein-Henoch's purpura, had had recurrent purpura, hematuria and a history of prolonged and profuse menstrual periods. Treatment was begun in the early part of 1932, twice a week. The patient was sensitized and desensitized. The first period after she had received treatment for several weeks was shorter and less profuse, hematuria disappeared and she was almost free from purpuric symptoms. The treatment was continued for six months. It had to be given for a number of months before striking improvement was noted.

CASE 21—I S, a boy, aged 12, with Schönlein-Henoch's purpura had had persistent recurrent purpuric spots on the arms and legs accompanied with pain and swelling of joints, occasional nosebleeds, intestinal colic and passage of blood. At the time treatment was started (March 1933) the symptoms had been approximately of six weeks' duration. By March 27 the patient was sensitized and desensitized. From then on he was treated once a week. Definite continuous improvement followed. The nosebleeds and hematuria have disappeared but occasional purpuric eruptions occur around the ankles. The treatment is now given once every two weeks and the only symptom that remains is the appearance of an occasional purpuric eruption around the ankles.

CASE 22—A F, a man, aged 60, had recurrent hemorrhagic bursitis of the elbows and knees. The blood picture was normal. Treatment was begun in March 1932. After five injections, the bursitis disappeared and has not recurred.

CASE 23—T C, a man, aged 42, had had recurrent purpuric eruptions on the legs for months, especially after drinking wine. The blood count was normal. He was treated twice a week from April 1932 through December 1932 with no effect.

CASE 24—Mrs B, aged 50, had recurrent purpura and occasional bizarre giant ecchymoses, from 5 to 6 cm in diameter, especially noticeable on exertion. The blood picture was normal, allergic tests were negative. A widespread localized edematous and hemorrhagic reaction followed the injection of venom. The patient was injected twice a week for months. At first it seemed as though there was a decrease in recurrences, but in the last few months the venom has had almost no effect on the course of this disease.

This form of purpura or recurrent ecchymoses is probably not a true clinical entity. It comprises conditions such as Schönlein-Henoch's purpura, or hemorrhagic capillary toxicosis, anaphylactic purpura or possibly ovarian dysfunction. The blood picture, especially blood platelets, coagulation time and clot retraction, is always normal. Occasionally the tourniquet test may be positive, indicating some form of capillary disturbance. Six out of nine patients treated showed immediate signs of improvement. Snake venom proved ineffective in three cases.

4 Osler's Disease (Multiple Hereditary Telangiectases)

CASE 25—Miss B, aged 23, had had epistaxis and nasal discharge for many years. In the past few years the nasal bleeding lasted at least twenty minutes, three or more times a week. Her father had frequent nosebleeds. Examination of the nares revealed multiple telangiectases in nasal mucosa and bilateral antrum disease. No relief of symptoms was obtained from local treatment or roentgen therapy. Treatment with snake venom was started, Oct 3, 1932. She became sensitized on the fifth injection and was desensitized by October 27 and then treated with venom once a week. October 31, the patient reported that there was no bleeding. There was no bleeding in November or December. In January a slight epistaxis occurred. She was then treated twice a month and the bleeding increased. She did not appear for three weeks and then reported several nasal hemorrhages. Under treatment given

once a week since that time no bleeding has been reported. The areas of telangiectases have markedly decreased in size.

CASE 26—W A, a man, aged 50, had had bleeding from the nose and mouth for six years. His father also had had frequent nosebleeds. The patient had been treated with radium with no relief. In the last two and a half months before treatment with venom, bleeding had been very profuse and almost daily. Small and large telangiectases were found on the tongue, the lips and the nasal mucosa, and small spider nevi were scattered over the body. The blood picture was normal. Treatment was started, Nov 11, 1932, two or three times a week in large doses of 1 cc. Within two weeks there was less bleeding. November 28, the patient became sensitized and as the amount of venom was decreased in the process of desensitization the bleeding recurred. By Feb 6, 1933, it was found that two injections a week of full 1 cc doses kept the patient under fairly good control, although bleeding tended to recur when the injections were decreased. Since that time, some of the telangiectases have disappeared.

CASE 27—Mrs S S, aged 49, had had daily nosebleeds for years. She had a sister and a daughter who bled from the nose. Telangiectases were found on the tongue, lips, mucous membranes of the cheeks and in the nasal mucosa. Treatment was begun, May 20, 1932. The hemoglobin was 74 per cent. Injections were made twice a week. The bleeding continued through May, at which time the hemoglobin dropped to 60 per cent. The patient was sensitized and desensitized, during which time the bleeding continued. In July, injections were given once a week because the patient could not come more often. The bleeding diminished. Later, treatment was given every two weeks until the present time. She still bleeds occasionally but there is a marked decrease in the amount and frequency. Once during this time she was admitted to the hospital and it was found that if the injections were given frequently (three times a week) bleeding could be controlled. The telangiectasia of the tongue have almost disappeared, although there are still some in the nasal mucosa.

CASE 28—M, a boy, aged 6 years, living in Maine, somewhat out of touch with an active clinic, was suffering from familial telangiectasia of the nose and had bled almost continually throughout the last half of his life. After the onset of the treatment a very encouraging record of some thirty-five days without any nasal hemorrhage was set. Then, after the onset of a nasal pharyngitis, he had four consecutive, severe hemorrhages. Resumption of the treatment with the venom was followed by a remarkable improvement.

Previous to treatment with snake venom, other forms of treatment were used, such as boiling water, coagulants, horse serum or radium, with only slight or no improvement. The treatment with the snake venom produced definite control of the bleeding. The treatment, however, in such cases must be kept up indefinitely, more frequently at first and less frequently later, once a week or once in two weeks, depending on the clinical effect. In two cases some of the telangiectases either disappeared or diminished in size.

B Diseases Associated with Bleeding as a Result of Definite Blood Changes—1 Thrombocytopenic Purpura Haemorrhagica (a) Cases followed by apparent improvement after snake venom injections.

Nine cases were treated. The patients varied in age from 5 to 65 years. There were eight females and one male in this series. The symptoms were typical in most of the cases, namely, hemorrhages from mucous membranes, purpura and ecchymoses in the skin and in a number of the women profuse and prolonged menstrual periods. Marked weakness and pallor had developed in some as a result of the loss of blood. In all the cases there was a marked reduction in the number of platelets, prolongation of the bleeding time, absence of clot retraction, a positive tourniquet test and a secondary anemia.

REPORT OF CASE

History—Mrs O B, aged 30, noted the first symptoms of pulmonary tuberculosis in February 1929. She was admitted to a sanatorium in April and was transferred to the surgical service of the University of Minnesota Hospital in December for thoracoplasty to obliterate a large cavity in the right lung. After the operation the patient gradually failed. There was continuous pain and discharge from the wound for over a year thereafter. In February 1931, about a year after the operation, albuminuria appeared. In March 1931 the liver was found to be markedly enlarged and amyloid disease was suspected. She was transferred to the medical service. She weighed 110 pounds (50 Kg), the blood pressure was 105 systolic 70 diastolic, and no edema was evident. The liver extended below the umbilicus, but the spleen and kidneys were not palpable. At this time 15 cc. of a 1 per cent solution of congo red dye was injected intravenously. After one hour all the dye was removed from the blood stream. The patient was given a high protein diet, cod liver oil, pills of ferrous carbonate and heliotherapy. Improvement gradually occurred, although her condition was regarded as hopeless. The spleen became palpable in April. At this time a roentgenogram showed an enormously enlarged liver and unusually large kidney shadows though within normal limits of size. During April and May persistent diarrhea occurred which was thought to be due to amyloidosis of the bowel. There was no evidence roentgenographically or otherwise of enteric tuberculosis. The patient continued to improve and after October 1931 her temperature, which had been elevated continually for two years, returned to normal. Her weight increased from a low level of 110 pounds (50 Kg) to 129 pounds (58.6 Kg) in December 1931, 142 pounds (64.5 Kg) in February 1932, and at the time of her discharge in May 1932, it was 159 pounds (72.2 Kg). The thoracoplasty wound was still being irrigated. The liver had diminished appreciably in size, and the spleen was still palpable.

Laboratory Observations—Persistent albuminuria was first noted in February 1931. The amounts ranged from 3+ to 4+ (boiled solid). The average amount diminished somewhat and after August was recorded as from 1+ to 2+ which persisted during the period in the hospital. The specific gravity of the urine during the period of albuminuria ranged from 1.009 to 1.029. Concentration-dilution tests performed in March and in October 1931 showed a range of specific gravity from 1.005 to about 1.017 on both occasions. The phenolsulphonphthalein test revealed 70 per cent excretion in two hours in September 1931 and 75 per cent in November 1931. Casts were seen on only a few occasions. Red cells and leukocytes were occasionally noted. In May 1931 the urinary proteins were composed of albumin 0.250 Gm. and globulin 0.134 Gm. The blood proteins totaled 6.06 Gm, of which 1.73 Gm was albumin and 4.33 Gm was globulin. The nonprotein nitrogen level was 22.5 mg and the blood urea nitrogen was 13 mg. The Rehberg test in May 1931 was 107.5 cc. In December 1929 the hemoglobin was 63 per cent and the red cells numbered 3,400,000. There was a diminution to 44 per cent and 2,000,000 respectively in May 1931 but on discharge from the hospital the hemoglobin had increased to 50 per cent and the red cells to 4,500,000.

The congo red test performed in April 1931 showed that all the dye had been absorbed, presumably by amyloid substance. Nine months later (January 1932) only 22 per cent of the dye was absorbed and in April 42 per cent was retained in the tissue, which represents the usual finding in normal persons and indicates resorption or disappearance of amyloid substance. The patient returned home and after a few months gradually resumed her housework.

In March 1935 the patient weighed 200 pounds (91 Kg). She had no symptoms of tuberculosis, felt well and did her housework. The wound had healed, the liver and spleen were not palpable, and the urine contained only a faint trace of albumin.

COMMENT

Until recent years a diagnosis of amyloid disease during life rested largely on a history of prolonged infectious disease, suppuration or a malignant condition and the signs of enlargement of the liver, spleen or kidneys, anemia and albuminuria without evidence, necessarily, of nephritis or nephrosis. Under

these circumstances the diagnosis was often uncertain, and if patients in whom the disease was suspected recovered it was considered doubtful that amyloid disease had existed. Following experimental studies which showed that amyloid substance was often resorbed, provided the causative factors were removed before the disease had progressed too far, and the introduction of specific tests for the disease, numbers of cases of recovery have been observed, to which the case here reported is added.

TREATMENT OF ACUTE DINITROPHENOL POISONING

M L TAINTER M D SAN FRANCISCO

Because of the widespread use of alpha-dinitrophenol in treating obesity and the repeated emphasis on its toxicity when taken in overdosage, a new toxicologic problem seems to be developing. This arises chiefly from the selection of dinitrophenol as the lethal drug by would-be suicides, but partly also as accidental poisoning resulting from use of proprietary or secret products containing the drug. In order to attain a position in the list of popular suicidal agents, a drug apparently must combine certain properties not necessarily related to its therapeutic usage. That is, its action must be dramatic enough to be associated in the lay mind with powerful effects and certainly fatal outcome. The drug must be commonly available, so that it can be taken without undue delay when the decision for suicidal attempt is made. It is also well known that the popularity of a drug for this purpose fluctuates in direct proportion to the newspaper space given to sensational accounts of its effect and suicidal use. These various factors are combined almost ideally in dinitrophenol to make it the poison of choice. Hence it is likely to appear with increasing frequency in cases of acute poisoning. That is, it is readily available, it has received the required newspaper publicity to establish it in the lay mind as a fatal drug, and it occupies an almost unique dramatic position in that it literally burns a patient to death. In view of these circumstances, practicing physicians should be informed of the symptoms and the proper measures to be used in treating such acute poisoning.

The symptoms of dinitrophenol poisoning may vary with the dose. High or toxic doses cause nausea and gastro-intestinal distress, marked sensations of heat, flushed skin, marked sweating, restlessness, rapid and deep respiration, and fever. As the fever increases, the respiration becomes extremely rapid and of maximum depth until the victim is using all his accessory muscles of respiration in a terrific effort to force more and more air into his lungs. There may be pain in the chest, or anginal cramps at this stage, as well as sensations of intense heat. If a fatal dose has been taken the respiration finally fails to keep up with the increased oxygen consumption, the blood becomes cyanotic, and anoxemia develops. With the anoxemia there is a piling up of lactic acid in the tissues which, associated with a high fever of over 110 F, quickly causes heat rigor of the skeletal muscle. The rigor appears first in the extremities and then spreads to the respiratory muscles, so that death promptly follows.

There is no specific chemical antidote capable of neutralizing or destroying dinitrophenol in the body. Treatment of such poisoning must therefore be directed at the symptoms and to the removal of the drug from the body. When the patient is first seen, the stomach should be washed out with large volumes of water, preferably containing sodium bicarbonate, 5 per cent strength. Dinitrophenol does not readily dissolve in water in the presence of the acid of the stomach, hence alkalization is desirable. A large volume of fluid may be left in the stomach to replenish the water that has been lost by the profuse sweating. Actual danger to life arises from the failure to oxygenate the blood and from the excessive fever. The oxygen saturation of the blood may be maintained by inhalation of pure oxygen through a mask or preferably in a suitable tent, if the latter is available. The fever can be combated by putting the victim in a bathtub containing ice water, or in an ice pack. This will generally reduce the body temperature very quickly and keep it within normal limits. However, the application of intense cold to the skin probably has other effects than mere abstraction of heat from the body. Animal experiments have shown that, at atmospheric temperatures of only a few degrees above freezing, the metabolic stimulation of the

SURGOWAX (Waxed Paper) ACCEPTABLE

Manufacturer, The Menasha Products Company, Menasha, Wis

Surgowax is a waxed paper especially prepared for surgical wet dressings. It is made from full bleached Hemlock pulp, under sanitary and sterile conditions. It is craped and steam treated and coated with refined paraffin. It is prepared in rolls, each strip 12 inches wide and 150 feet long, and each roll encased in a cardboard carton with a cutter edge.

Claims for this product, according to the firm, are that it is moisture resistant, soft and pliable, will not irritate tissues and will conform to the shape of any part of the body to which it is applied as a bandage. This makes it desirable as an economical method in connection with wet dressings.

Surgowax has been used in a clinic acceptable to the Council for several months. It was found to be a good protective covering for wet dressings. It can be molded into position about joints or about the face better than can stiffer material commonly used in covering wet dressings.

Surgowax (Waxed Paper)

In view of the favorable report the Council on Physical Therapy voted to include Surgowax in its list of accepted devices.

NU-HESIVE GAUZE BANDAGE ACCEPTABLE

The Nu-Hesive Gauze Bandage a latex-treated bandage, is manufactured by the Diadem Surgicals, Inc., Fitchburg, Mass. Packing of Nu-Hesive is in two forms: one, the hospital and physician's line, is packed twelve rolls, individually and cellophane wrapped, in each box; two, the retail line, is packed forty-eight one-inch to the carton; each roll in a separate box, and the two-inch, twenty-four in.

Nu-Hesive Gauze Bandage is the trade name for the product. It is made from sterilized gauze which is impregnated with a practically nonabsorbent cohesive latex, leaving the interstices of the fabric partially open. The process of application requires squeezeroll control of the quantity of applied latex solution, followed by electric-heat-radiation drying while in suspension. Five-yard rolls are wrapped with paper in the machine, following which a bandage cut-off operation is accomplished with knives running in sterilizing solution. According to the firm the cellophane-wrapped rolls, with one end still open, are placed in a sterilizing cabinet for sufficient time to destroy bacteria; the rolls individually boxed are sterilized in the same way with the box, before closing.

Nu-Hesive gauze bandage

The company claims that the package is sterile and free from bacteria and micro-organisms that is until it is opened. It is quick to apply and is strong yet it can be torn off as used, no scissors are needed. It will not stretch or shrink, sticks to itself, and will not adhere to the wound or skin. Surface bleeding may be stopped with a four-layer coverage. The bandage is not affected by water or by alcohol and it does not loosen easily. It is a stiff support, several layers produce a "cast" effect. There is little or no discoloration of the area covered.

The firm does not claim that 'Nu-Hesive' eliminates entirely the use of ordinary cotton bandage or adhesive bandages but in selected instances it is of great value. After the Council investigated "Nu-Hesive" it was recommended for and included in the Council's list of accepted products.

Council on Pharmacy and Chemistry**PRELIMINARY REPORTS OF THE COUNCIL**

THE COUNCIL HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORT
PAUL NICHOLAS LEECH Secretary

SNAKE VENOM SOLUTION MOCCASIN (LEDERLE)

Elsewhere in this issue of THE JOURNAL appears an article by Peck and Rosenthal¹ on the "Effect of Moccasin Snake Venom in Hemorrhagic Conditions." At the suggestion of the authors the manufacturer (Lederle Laboratories, Inc.) has submitted the product to the Council in order that a statement of the Council's conclusions might appear in the same issue as the report of the investigators.

Snake Venom Solution Moccasin was first used experimentally by Peck and Sobotka,^{2a} who attempted to produce Schwartzman's phenomenon (local hemorrhagic necrosis) by the use of local and intravenous injections of bacterial toxic filtrates with fungus extracts. They injected rabbits with snake venom and, after allowing from fourteen to thirty days to elapse, found these animals refractory to Schwartzman's phenomenon. Further experimentation determined that there were no circulating antibodies and that antivenin had no effect on the course of the phenomenon. They therefore believed that the induced refractory state was due to some change in the vessel wall which prevented the occurrence of the phenomenon.

Peck² found that while moccasin and copperhead venom produced this refractory state bothrops and rattlesnake venoms did not. He also found that it was necessary to titrate moccasin venoms for potency and that there was no relationship between the toxicity (i. e., neurotoxicity) of individual moccasin venoms and their ability to produce the refractory state. These experiments were followed by the clinical use of moccasin snake venom in various hemorrhagic conditions.³

ADMINISTRATION AND DOSAGE

In the earlier work of Peck³ and of Peck and Goldberger⁴ the venom was given intradermally; later Peck and Rosenthal⁵ reported that subcutaneous injections gave the same results and were less painful to the patient. The material to be injected consisted of the venom diluted 1:3,000 with physiologic solution of sodium chloride. Further dilutions were sometimes necessary for desensitization. The procedure now reported consists of an initial dose of 0.4 cc, which is subsequently increased to 1 cc. Injections are given twice weekly, variation being governed by the effectiveness of the treatment, sensitization and recurrence of symptoms. The same principles apply to the dosages for children, in which the minimum is 0.2 cc and the maximum 0.6 cc. These dosages are said to have been used successfully in children 1 year of age. Successive injections were usually given in the same extremity.

USUAL REACTION

Local reaction is reported to occur at the site of the injection and to vary considerably in the size of the ecchymotic area. This occurs principally with the first few injections.

SENSITIZATION AND DESENSITIZATION

Peck⁴ had previously reported hypersensitivity in 75 per cent of patients with allergic manifestations, a changed reaction in

HOSPITAL SERVICE IN THE UNITED STATES

FOURTEENTH ANNUAL PRESENTATION OF HOSPITAL DATA BY THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS OF THE AMERICAN MEDICAL ASSOCIATION

The significance of the hospital as a social institution must impress any one who ponders the compilations presented in these pages. Our thanks for this valuable information are due officers who have so generously responded to our inquiries.

The usual questionnaires were mailed to 6,437 hospitals, and reports were received from 6,230, a percentage of 96.78 replying. Reports still are coming in

ber 1934. The average daily census of patients was 830,098, an increase of 19,827 over 1933.

Patients were admitted to hospitals at the rate of one every 4.41 seconds, including Sundays and holidays.

General hospitals admitted 6,291,556 patients, or 88 per cent of all patients admitted.

The total number of births reported in hospitals was 701,143.

Federal - 37 days

State - 21.5 days

County - 20.6 days

City - 15.5 days

City-County - 17.4 days

Church - 11.4 days

Fraternal - 17 days

Association - 11 days

Ind. and Part. - 8 days

Corporation - 9 days

Governmental - 21.2 days

Non-Proprietary - 11.2 days

Proprietary - 8.7 days

Average length of stay per patient in general hospitals, for 1934

In addition to the foregoing, there are 221 hospitals in Alaska, Hawaii, Puerto Rico and elsewhere, figures from which will be presented separate from those for the states, near the close of this article.

All the hospitals of this country admitted 7,147,416 patients during the period under survey, which corresponds in general with the calendar year 1934, since reports were received mainly in November and Decem-

ber 1934. One person in seventeen made use of a hospital during the year, according to the federal census of 1930, and one in eighteen according to the estimated census for 1934.

The number of idle beds reached a record total of 218,003, of which 156,030 were in general hospitals.

The average length of stay per patient in general hospitals was fourteen days, in mental hospitals, 1,034 days.

In the governmental general hospitals the average length of stay was twenty-one days, and in the non-governmental general hospitals eleven days.

The growth of hospitals for the last twenty-five years has been at the rate of 25,000 additional beds each year.

The growth of hospitals for the last twelve months equals over fifty-seven beds for every day in the year, including Sundays and holidays.

There are 2,226 superintendents who have the M.D. degree, 2,551 registered nurses, and 1,545 without medical or nursing degrees.

Hospitals in the United States employ 6,105 laboratory technicians and 4,300 x-ray technicians.

The measure of quantity of hospital service is the patient day—that is, the care of one patient for one day. During the last year the patient days in all hospitals numbered 302,985,770, a gain of 7,236,855 over the previous year.

The number of hospitals now in the Register of the American Medical Association is 6,334, as compared with 6,437 one year ago, a net decrease of 103 hospitals. This decrease was caused, in part, by thirty-one (net) custodial institutions closing their hospital departments and sending their patients to neighboring general hospitals. The net loss of thirty-nine general hospitals was due mainly to the closing or temporary discontinuance of small institutions for lack of patronage. Forty were dropped from the Register on grounds of ethics, as against twenty-one restored from those formerly rejected. Some were closed on account of merger, and a few have been deleted for lack of information.

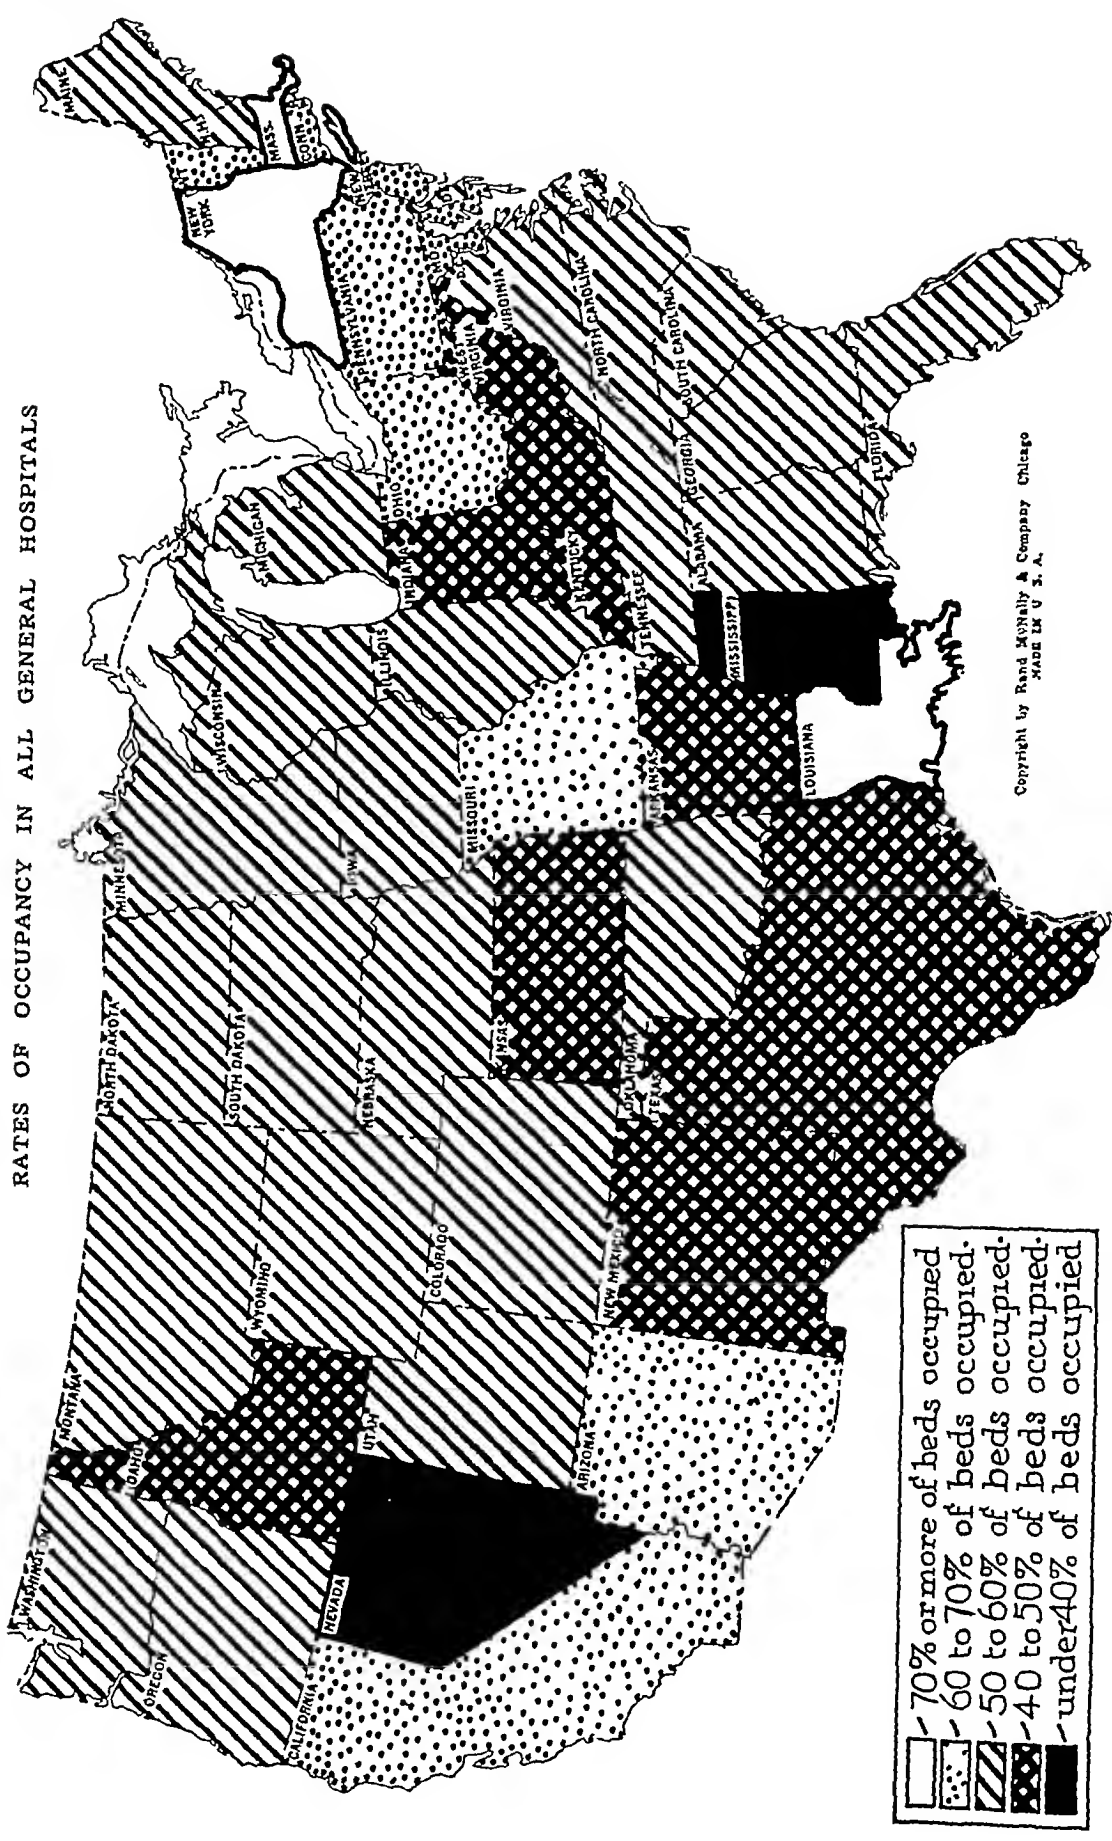

In the twenty-five years from 1909 to 1934, during which time the total number of hospital beds mounted from 421,065 to 1,048,101, or an average of 25,081 additional beds a year, there was an almost uniform rate of increase throughout the period. Comparatively little difference was made by war, depression or any other condition. The various departments of government agencies, organizations and individuals that have

CHURCH, FRATERNAL AND OTHER NON-PROFIT ORGANIZATIONS

The nonprofit group of institutions, including church and fraternal, comprise mainly general hospitals which care for patients with acute sickness or injury on a pay basis as contrasted with local county and city hospitals which are employed mainly for the care of indigent sick. As is well known, the nonprofit group, however, also renders a very large amount of charity or indigent service

The number of hospitals reported under church control is 970 as compared with 984 for the previous year. In the same time the bed capacity dropped from 115,840 to 113,263, bassinets now number 16,067 as compared with 16,190 last year. In the number of patients

slight gain. They admitted 34,700 patients, compared to 36,817 last year. At the same time the average census rose from 3,487 to 3,601, indicating that the average period of stay in fraternal hospitals has increased during the year

Other nonprofit corporations, in addition to those under church and fraternal auspices, reported under this classification for the first time, have to their credit 1,604 hospitals with a capacity of 149,038 beds and 20,034 bassinets. They admitted 2,342,513 patients and they had an average daily census of 89,615. The total nonprofit civilian hospitals, including church, fraternal and the other hospitals, run on a nonprofit basis but, not including governmental, number 2,646, with a capacity of 267,712 beds and 36,251 bassinets. They

increase of 220,044 over one year ago. The average daily census was 237,395 as against 231,692 one year ago.

Among the 4,198 general hospitals are 537 that reported that they have tuberculosis departments and that they admitted 40,900 patients to those departments last year. In addition, there were 188 general hospitals which reported 5,262 patients admitted but said that they did not have a separate tuberculosis department. Combining these figures, therefore, we find that the grand total of tuberculosis patients admitted, as such, to general hospitals was 46,162.

It is among the general hospitals that hospitals approved for internship training are selected. At the present time the 708 hospitals offering internships acceptable to the Council employ 6,376 interns.

COUNTIES WITH AND WITHOUT GENERAL HOSPITALS

The number of counties having general hospitals located within their boundaries is 1,779 as compared with 1,296 counties that do not have registered hospitals, located within their boundaries. Each hospital, of course, serves its community or territory regardless of imaginary boundaries. In 1920 there were 1,332 counties that had general hospitals located within them and 1,695 that did not have them. Between 1920 and 1934 the total number of counties increased by division from 3,027 to 3,075.

The forty-eight state maps interspersed among the list of registered hospitals in this issue give the location, state and county, of each hospital.

NERVOUS AND MENTAL HOSPITALS

As usual, mental hospitals show the greatest increase in capacity and occupancy. The Register lists 614 mental hospitals, seven less than last year, but the capacity is 513,845 beds, a gain of 14,890. They admitted 172,415 patients, an increase of 1,582. There was an average of 488,481 patients and inmates in the mental institutions.

TUBERCULOSIS HOSPITALS

Tuberculosis hospitals show comparatively slight numerical changes from year to year. The present tabulation includes 495 tuberculosis hospitals and sanatoriums with 70,063 beds, 82,455 patients admitted, and

an average census of 59,689. Something is said regarding tuberculosis farther along in this article under "Survey of Tuberculosis Hospitals."

OTHER SPECIAL HOSPITALS

The maternity hospitals in the Register, 134 a year ago, now number 130, having 7,625 beds, 4,131 bassinets, with 76,980 patients admitted and an average

Grand total general hospitals	4,198	393,425	47,806	648,905	6,201,506	237,395	80,649,175

daily census of 4,647. These figures are all less than for corresponding items one year ago.

Industrial hospitals number 113, having dropped five during the year. The capacity, 5,575 beds, was 5,923 last year. They admitted 69,609 patients as compared with 69,748 last year, and the average census was 2,423, a decrease of 197 in one year.

The fifty-five eye, ear, nose and throat hospitals, having 2,793 beds, admitted 103,720 patients, and the average census was 1,265. This group showed little change during the year.

There was no change in the number of the next three groups, there being fifty-eight children's, sixty-nine orthopedic and seventy-one isolation hospitals, the same as the previous year. Neither was there appreciable change in the capacity and occupancy of these three groups.

Hospitals and homes for convalescence and rest in the Register are limited to places that are equipped for medical and nursing care. There are 125, as compared with 130 a year ago, the capacity, 5,456, remaining practically unchanged, with a decrease in the patients admitted from 27,383 to 24,083. The average daily census dropped from 3,802 to 3,580.

Hospital departments of institutions dropped during the year from 343 to 312. The institutions that discontinued their hospital departments made arrangements to have their charges hospitalized in existing general hospitals. Some of the institutions increased their hospital facilities so that there are now 21,982 hospital beds as compared with 21,582 last year. The total number of patients was 135,272 or 15,802 less than last year.

The foregoing figures, by groups, account for all types of hospitals except ninety-four that are unclassified, which, however, show a total of only 8,132 beds and admitted 36,730 patients.

department In 1933 there were 4,677, or 72.66 per cent, and in 1934, 4,488, or 70.86 per cent. Physicians serving as radiologists were reported for 1933 in 3,487 hospitals and for 1934 in 3,403 hospitals. Institutions having other than physician-radiologists numbered 892 in 1933 and 703 in 1934. Hospitals reported that they employ 4,300 x-ray technicians.

PHYSICAL THERAPY, DENTAL AND NURSING DEPARTMENTS

The present census shows that 2,008, or 31.7 per cent of hospitals, have physical therapy departments, as compared with 2,091 in 1927, or 30.72 per cent of hospitals then existing.

Dental departments have increased since 1927 from 796 to 1,168 and the number of dentists named as having hospital connection increased at the same time from 1,682 to 3,277. By referring to the accompanying table it will be seen that the number of dental departments has increased by 100 per cent or more in thirteen states.

Schools of nursing numbered 1,814 in 1927 and 1,531 in 1934, including for both years only the schools of nursing accredited by their respective state boards of nurse examiners. In addition, there were 264 unaccredited schools in 1927, and only eighteen in 1934.

SUPERINTENDENTS IN HOSPITALS

Thirty-five per cent of the superintendents or executives of hospitals are physicians holding the M.D. degree, 40 per cent are registered nurses, and 25 per cent are persons without medical or nursing degrees. The number of physicians serving as hospital superin-

tendents was 2,226 in 1934, 2,312 in 1933, and 2,648 in 1925. Registered nurses for the same three years respectively numbered 2,551, 2,559 and 1,676. Superintendents not holding medical or nursing degrees, for the same years respectively, were 1,545, 1,548 and 2,528. The number of physician-superintendents is relatively high in states having a number of large hospitals.

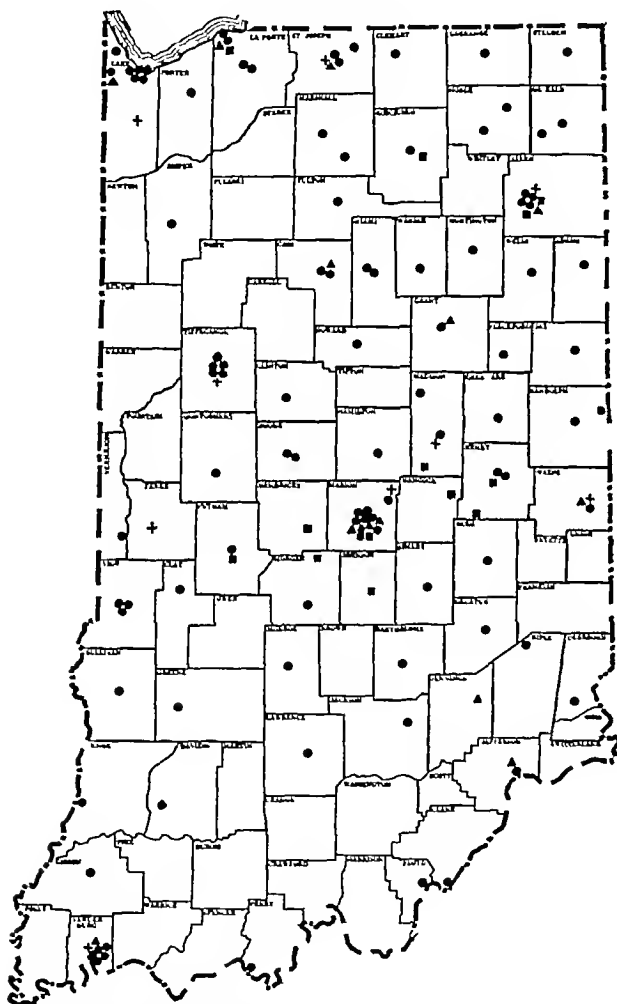

BIRTHS IN HOSPITALS

The total births reported by all hospitals this census numbered 701,143, or 8,133 less than in 1933. There were 48,048 births in maternity hospitals, as compared with 55,249 in 1933. There were 648,995 in general hospitals, or 885 less than in 1933. Federal hospitals reported 6,098 births—a gain of 1,028 over 1933 and 3,802 over 1929. Births in governmental hospitals were 144,419—a gain of 2,740 over the previous year. The nongovernmental hospitals reported 556,724 births—a loss of 10,873 as compared with the previous year.

Key to symbols and abbreviations is on page 1091

siderable investigation is carried out in the case of each hospital before it is admitted to the Register

First, hospitals supply information regarding their capacity, equipment, classification and list of staff. Each member of the staff is then looked up in the biographic files of the Association. Information and advice are obtained from the secretaries and other members of the county medical societies, from state, city or county health departments, from the councilors of the state medical association for the district in which the hospital is located, and from other sources. Investigation of hospitals for internship and residency approval is more comprehensive than for registration.

A personal visit by a member of our staff of hospital examiners is made to each hospital approved, or applying for approval, for internships or for residencies. An increasing number of other hospitals are being inspected.

The list of registered hospitals, by states, begins on page 1091 of this issue, where considerable data are given about each hospital. Classifications, symbols and abbreviations are explained at the head of the list. The list in each state is given in two sections: (1) hospitals and sanatoriums, and (2) related institutions. The related institutions include some general hospitals lacking certain essentials, nursing homes, school infirmaries, prison infirmaries, custodial and other institutions designed to give some medical, nursing or convalescent care in an ethical and acceptable manner, but not strictly hospitals. In the statistics the two classifications are consolidated.

Hospitals Sanatoriums and Related Institutions

	Hospitals	Beds	Bassinets	Births	Patients Admitted	Average Census
Hospitals and sanatoriums	4,897	879,310	50,012	687,847	6,235,087	637,343

Hospitals in Alaska Canal Zone Guam Hawaii, Philippine Islands Puerto Rico and Virgin Islands

Alaska	19	485	69
Canal Zone	10	1,642	39
Guam	1	60	
Hawaii	47	4,641	232
Philippine Islands	98	8,132	404
Puerto Rico	41	3,210	194
Virgin Islands	5	320	22
Totals	(1914) 221	18,430	1,020
	(1933) 215	18,794	1,020
	(1937) 204	18,330	720

There are 221 hospitals located in these territories. The distribution of those hospitals and their capacity are shown in the accompanying table. The total number of beds is 18,430 and of bassinets 1,020. Alaska with nineteen hospitals gained one during the past year, Hawaii with forty-seven has gained two, Philippine Islands with ninety-eight has added three, Puerto Rico with forty-one hospitals and the Virgin Islands with five remain the same. The statistics of the number of beds, the number of patients admitted, average census of patients and number of births for the year are omitted for these 221 hospitals, because such statistics have been received from only 70 per cent of these hospitals as this article goes to press.

HOSPITALS REFUSED REGISTRATION

There are 569 institutions which, because of alleged unethical or questionable practices, admission to their staffs of members who are seriously unqualified, either morally or professionally, flagrant methods of advertising, or for other valid reasons, are deemed unworthy of being included in any published list of reputable hospitals.

Hospitals Refused Registration

Alabama	5	Maine	7	Oklahoma	18

Iowa	10	New York	31	Wisconsin	6
Kansas	27	North Carolina	6	Wyoming	3
Kentucky	10	North Dakota	3		
Louisiana	2	Ohio	27	Total	569

Only a little over 1 per cent of the total capacity of all hospitals is included in the 569 institutions that are refused registration. From the standpoint of hospitalization, therefore, they are, as a rule, not needed. Not only are they left out of the Register and the American Medical Directory but their names are consistently omitted from all the publications of the Association and they are refused admission to the advertising columns.

This helps to distinguish between the good and the bad in hospitals. As a result, it is considered a disgrace among hospitals and physicians to be refused registration, and institutions that are rejected are frequently aroused and correct the objectionable practices in order that they may be recognized. Public and professional opinion forces many such institutions to sell their buildings to more reputable owners or to close up.

The Register is used as a basic list of hospitals. Industrial and governmental agencies use it in selecting hospitalization for their dependents and beneficiaries. Physicians almost universally observe the Register in referring their patients.

The good work that the American Medical Association has accomplished by its vigilance in distinguishing between the fit and the unfit in the hospital field has been shared very largely by other organizations. The American College of Surgeons has cooperated by refusing to consider for its approval an unregistered hospital, and the American Hospital Association has followed the Register in considering applications for institutional membership. It is evident, also, that the public in general limits its patronage and its donations to hospitals that are considered worthy of a place in the Register.

MISCELLANEOUS FACILITIES FOR MEDICAL AND NURSING SERVICE

In addition to the 6,334 registered hospitals, sanatoriums and related institutions, and in addition to the 569 institutions refused registration, there is an unknown number of small places, some of which afford suitable living accommodations and medical and nursing care of a limited or special type. Among them are emergency stations, doctors' offices with living accommodations, small nursing and maternity hospitals, and

procedure as offering superior advantages. The following suggestions, therefore, should be considered as having practical value since they represent, at least in part, successful methods in certain hospitals or medical schools at present.

INTERN SUPPLY AND DEMAND

The excess of approved internships over the number of applicants, which at one time was stated to be as much as a thousand places, has largely disappeared. An investigation has been made, therefore, into the number of available internships, the results of which are presented in the accompanying table. The three important factors which have reduced the number of openings each year are the increasing length of internships, repeaters, and the placement of foreign graduates.

There were 2,222 interns in the group serving over twelve months—on the average 20.7 months. Yearly replacements in this group, therefore, will amount to 1,285. By subtracting these figures from the total number of approved internships and total graduates seeking internships, there remain 3,982 twelve month services for 3,714 applicants, an excess of 268. However, the Council has records of 113 men who are repeating a year's rotating service. The number of foreign graduates placed will approximate this figure and, as a result, the Council has requested that hospitals which it has approved assign no internships to foreign graduates until all applicants from our own class A schools have been placed.

This scarcity of internships has been in part due to the temporary abandonment of intern training by the Navy, Army and Marine hospitals. The two latter groups of institutions are completing details for active resumption of intern training. With these and other hospitals recently approved and reinstated, about 172 additional openings will be provided.

SELECTION AND APPOINTMENT OF INTERNS

Hospital administrators, intern committees and deans of medical schools have at various times testified concerning the unsatisfactory methods now employed in making application for, and making appointments to, internships. Under existing circumstances, an enormous amount of energy and correspondence is necessary on the part of all involved—the intern, the hospital, and those who are called on to write character and aptitude references for applicants.

Many of the present difficulties could be minimized if practices already engaged in by deans or faculty intern committees could be enlarged and directed in more effective channels, if uniform application blanks were in use, if (still more important) uniform times of application and appointment were observed and, finally, if a central coordinating and placement bureau were established.

The following procedures are offered as suggestions for further discussion and improvement. Since most internships commence July 1, methods are recommended on this basis, but time relationships would be the same for appointment at any period.

1 The first step involves acceptance of a uniform internship application blank by all approved hospitals which will supply intern committees with sufficient data for intelligent selection of interns. These blanks will be handled as follows:

(a) Duplicate blanks will be supplied to each candidate at the medical school. He will submit these blanks properly filled out, together with his photograph, to his dean or faculty intern committee.

(b) The medical school authorities will verify the submitted data and add in space provided the candidate's class standing and their estimate of the student's probable performance as an intern.

(c) The candidate will submit at the same time as he presents his application, and on a separate form, his first, second and third choice of hospital.

(d) On an agreed date, for example, February 1, the original applications are sent by the dean to the first choice hospital. The duplicates are retained in the medical school files to provide against loss or other mishap to the original applications.

2 On receipt of the blanks, the hospital intern committee makes a selection of acceptable applicants—additional data if necessary are secured, arrangements for personal interviews are made, and any other procedures in keeping with hospital custom are carried out. Contracts are then dispatched to successful candidates and, if satisfactory, signed, witnessed and returned. All applications from unsuccessful candidates are returned to the medical school before March 1.

3 This second step will have been completed by March 1 and the entire procedure, using the same blank, is repeated for the second and third choice hospitals the months of March and April being used to complete the performance.

Available Approved Internships

Number of approved internships September 1934	6,204
Average length of internships	18 Mo
Graduates seeking internship, 1934	4,990
Interns serving over 12 months	2,222
Total months served	46,064
Average length of internship	20.7 Mo
Internships available in 1934	1,285
Twelve month internships	3,062
Total months served	47,764
Graduates placed in this group	3,714
Excess of internships over 1934 graduates	268

4 As soon as a hospital has obtained its complement of interns, the central bureau is notified and suitable means are taken by it to notify the medical schools.

5 The names of all candidates unabsorbed by May 1 would be submitted to the central bureau. Likewise, all approved hospitals would supply the same bureau with the number of unfilled appointments. Adequate arrangements for publicity or more direct methods of bringing intern and vacancy together could readily be brought about.

To be completely successful, this plan would operate even in hospitals controlled by or within the sphere of influence of the schools, or where other close relationship exists between medical school and hospital.

The plan seems to preserve to both hospital and intern as much free choice in selection as exists at present, imposes no great added burden to medical school committees, and relieves interns of the anxiety and physical burden of writing dozens of futile applications during the important closing months of their academic careers.

RECORDS OF INTERNSHIPS AND RESIDENCIES

The attention of all hospitals approved for internship or residency training has been directed on several occasions to the provision made by the Council for accurate registration of all hospital services in the biographic files of the American Medical Association. Hospitals have been asked, therefore, to maintain adequate records (as to the exact duration and type of experience obtained) on each intern or resident.

HOSPITALS REGISTERED BY THE AMERICAN MEDICAL ASSOCIATION

The following list contains the names of 6,334 hospitals, sanatoriums and related institutions that are located in the United States and 221 in Alaska, Canal Zone, Guam, Hawaii, Philippine Islands, Puerto Rico and Virgin Islands. It omits the names of 569 hospitals which, after investigation, were not accepted. The inclusion of the name of any institution may be taken as an indication that evidence concerning irregular or unsafe practices in that institution has not come to the attention of the Council on Medical Education and Hospitals. The list in each state is given in two sections: (1) hospitals and sanatoriums, and (2) related institutions. The related institutions include some general hospitals lacking certain essentials, nursing homes, school infirmaries, prison infirmaries, custodial and other institutions designed to give some medical, nursing or convalescent care in an ethical and acceptable manner, but not strictly hospitals. In the statistics the two classifications are consolidated. The words "No data supplied" following the name of a hospital mean that no report was received although at least three requests were sent.

KEY TO SYMBOLS AND ABBREVIATIONS

- * Approved for general internship, the fifth year in medicine by the Council on Medical Education and Hospitals
- + Approved for certain residencies in specialties for graduates in medicine who have already had a general internship or its equivalent in private practice

- ◊ School of nursing accredited by state board of nurse examiners
- ◊ Affiliated for nurse training on state accredited basis

The column headed "Type of Service" tells what diseases or conditions are treated in each institution, as follows:

Ca	Cancer	ENT	Eye, ear, nose and throat	Inst	Institutional	Orth	Orthopedic
Card	Cardiac	Gen	General	Mat	Maternity	SKCa	Skin and cancer
Child	Children	G&TB	General and tuberculosis	MatCh	Maternity and children	TB	Tuberculosis

HOSPITAL DISTRIBUTION AND HOSPITAL SERVICE

In this issue of *THE JOURNAL* appear the usual list of hospitals registered by the American Medical Association and the data relative to bed capacity, the average number of patients and the patients admitted. At the same time there is made available a survey of the occupancy of various types of hospitals during the last year. The reports are based on a study of 6,334 hospitals with an average daily census of 830,098 patients. The figures indicate that one person in seventeen made use of a hospital during the year. The average length of stay per patient in general hospitals was fourteen days. The other data that are available indicate that hospitals have also improved in the provision of laboratory, x-ray and physical therapy services.

The number of hospitals now in the United States has decreased by 103 over the number reported one year ago. This loss is explained by the development of certain mergers, and the closing of hospital departments of certain custodial institutions. Especially significant in the statistics now made available are the data relative to the length of stay of patients in hospitals. The length of stay of patients in governmental and nonproprietary institutions is considerably beyond that in independent, proprietary and corporation hospitals.

While the figures show that the number of idle beds in 1934 reached a record total of some 218,000, the patient days in all hospitals were almost 303,000,000, a gain of more than 7,000,000 over the previous year.

Almost coincidental with the publication of these data by the hospital department of the American Medical Association there has appeared a consideration of the need for more hospitals in rural areas published under the auspices of the *Modern Hospital*.¹ The statement indicates that this study, made by Alden B. and Patsy Mills, involved spotting local and community hospitals in various parts of the country on maps and then analyzing the maps in relationship to statistics of

population and measurements of distance. The results of the study indicate the fallacies that invariably arise in this type of survey. The authors conclude that 1,300 of the 3,075 counties of the United States containing 18,000,000 persons have no hospitals within their borders. They come to the conclusion that there are a considerable number of rural areas now without hospitals which ought to have them. The authors recognize that certain counties are often too small a unit to contain a satisfactory hospital and that frequently some counties do not have hospitals because good ones exist in cities just over the border in a neighboring county. Nevertheless an analysis made by the hospital department of the American Medical Association indicates the generally fallacious character of their observations. As shown in the accompanying table, 2,003 rural hospitals in the United States during 1934 had 50.2 per cent of their beds occupied. Moreover, 2,031 urban hospitals had 62.4 per cent of their beds occupied. While an occasional area might at this time actually require a hospital and be able to support one, the percentage of unoccupancy would indicate the hazard as either a commercial, scientific or philanthropic venture of attempting to establish new hospitals in a period of economic stringency such as now exists.

General Hospitals in Rural Areas Compared with Those in Urban Districts*

	Rural Places under 10,000 population				Urban 10,000 and over		
	No. of Hospitals	Beds	Base nets	Average Patients	Patients Admitted	Per Cent of Occupancy	Length of Stay
Rural	2,003	68,500	10,710	34,529	1,073,603	50.2	13.4
Urban	2,031	282,023	37,921	170,060	5,022,426	62.4	13.4

* Including all registered general hospitals except army, navy, marine and veterans.

Using the method developed by Mr. Mills and his associates for studying hospital distribution as applied to the state of Alabama, one finds a need in that state for 1,905 more hospital beds. In developing their data they included three Florida counties and two Mississippi counties in Alabama and assigned two Alabama counties to Mississippi. A restudy of the situation reveals, however, that those areas to which they allocate the 1,905 additional beds already have sixty general hospitals whose combined capacity is 3,842 beds, of which only 1,778 were occupied. This means an average of 2,064 idle beds in a territory assumed to require 1,905 additional beds. The detailed statistical data concerning this situation are available for those who are interested.

Above all, these comparative studies indicate the danger inherent in attempting to analyze local situations in states far removed on the basis of data found in card indexes in an office in Chicago. In another issue of the *Modern Hospital* appears a series of comments² by Michael M. Davis, Kendall Emerson, Samuel A.

1 Mills, A. B. and Mills, Patsy. The Need for More Hospitals in Rural Areas. *Modern Hospital* 44: 50 (March) 1935.

NAL, while information regarding the chemistry of the hormones is far more elaborate today than a few years ago, "only a beginning has really been made in our knowledge of this exceedingly complex and fascinating field." In view of the current intensive work on the constitution of the hormones, it is safe to predict that the story of the chemistry of many more of these powerful regulators of physiologic processes will soon be revealed.

THE STRUCTURE OF THE CELL

The usefulness of microscopic sections in investigative and clinical work has long clouded the fact that such pictures of cell structures are obtained only after subjecting the tissue to various physical and chemical procedures in order to make them visible. The technical methods of fixation and staining yield beautiful colors and a variety of lines and shades which are interpreted widely as evidence of what exists in the living cell, healthy or diseased, but this confidence in the reality of observations made by the usual technical methods has been gradually disappearing. The change in attitude has been aided by the results that have been achieved through direct studies of living tissue made possible by dark field illumination, tissue culture, microdissection, micrometabolism, vital staining and other methods.

The defects of the ordinary stained microscopic section have become apparent also with the realization that morphology cannot be divorced from function and that function depends to a great extent on the chemical changes that constantly go on within and between cells. Many recent studies, for example, have shown that the cancer cell has characteristic properties referable not so much to its shape or form as to its chemical behavior, particularly in relation to the chemical behavior of normal cells. Attempts have been made for decades to study the actual chemical structure of cells, but the problem has been beset with many difficulties. In making cellular details visible, profound alterations in their physical and chemical state occur. Within the last few years, however, the Altmann freezing-drying method has been elaborated at the Hull Laboratory of Anatomy of the University of Chicago and has been found to yield preparations of undenatured material on which a number of cytologic problems have been investigated. These observations have been recently published in a series of papers by Bensely and Gersh¹ and by Bensely and Hoerr.²

First the Chicago investigators attacked the problem of the chemical nature of mitochondria, those struc-

tures in the cytoplasm to which important functions have been attributed. The mitochondria contain 43.6 per cent of fatty substances but no lecithin or cephalin. They contain two different proteins. The so-called Nissl substance of the nerve cell is not uniformly distributed through the cytoplasm. Their variations as seen in disease may be due in part at least to artefacts produced by the fixation methods. Still other experiments have led to new conceptions of the structure of the cell nucleus, indicating among other things the possibility of a synthesis of nucleoprotein in the nuclear juice. Such fundamental considerations as the actual chemical basis of the organization of the cell form the topic of additional observations. They lead to the elucidation of the great biochemical riddle of the difference between protoplasm and solutions of protein.

These results have profound significance. In inflammation and repair, in bacterial and metabolic disease and in cancer the mystery of cellular activity holds the ultimate key to our understanding of disease. Life itself in the last analysis depends on cell structure and behavior. Many tools have been used to pry open the secret of the cell, but tools are only the eye-pieces of the scientific worker. Industrious and intelligent as he is, the practical inferences from his work depend on how closely his vision reaches to reality. Technical methods are nowhere more important than in the domain of the microscopic world. The boundaries of vision extended by the microscope now await only such methods as will not distort the living cell but actually bring to light its chemical behavior. The investigations that are being carried on by Bensely and his co-workers are precisely in this direction.

Current Comment

GENERAL SCIENTIFIC MEETINGS AT ATLANTIC CITY

The General Scientific Meetings arranged for the Cleveland session were so successful that they have been developed still further for the meeting to take place in Atlantic City from June 10 to 14. The complete program of the General Scientific Meetings appears under Association News in this issue of *THE JOURNAL* (page 1177). It will be noted that these meetings occupy three half-day periods on the first and second days of the annual session. They cover a wide variety of topics of current interest, including particularly changes in the blood, questions of diagnosis, and advances in endocrinology and therapeutics. These three special meetings, in which physicians from all over the United States and Canada will participate, constitute a concentrated postgraduate course for the general practitioner who wishes in a brief period to bring himself abreast of current knowledge in many fields.

Samuel D. Ingham.—San Francisco reported an infant mortality rate of 33 per thousand in 1932, the lowest rate on record, an increase was noted in the birth rate, 104 per thousand—Dr. Frederick C. Warnshuis, San Francisco, addressed the San Francisco County Medical Society, March 12, on "The Medical Profession's Declaration of National Principles as Related to Medical Economics."

COLORADO

Narcotic Drug Law Enacted.—Two bills, which were approved by Governor Johnson March 16 and which were to become effective immediately, are of considerable interest to physicians. One of them (H 557) prohibits the retail sale except on the written prescription of a licensed physician, dentist or veterinarian, of barbital, sulphonethylmethane (trional), sulphonmethane (sulphonal), diethylsulphon diethylmethane (tetral), paraldehyde, and chloral or chloral hydrate or any derivatives compounds or mixtures of any of these drugs possessing hypnotic properties or effects. The other (H 138) is the uniform narcotic drug act, drafted by the Conference of Commissioners on Uniform State Laws with the aid of the Bureau of Legal Medicine and Legislation of the American Medical Association, and approved by both the American Medical Association and the American Bar Association. The term "narcotic drug," as used in this law, includes coca leaves, opium, cannabis and every substance neither chemically nor physically distinguishable from them. A physician or a dentist, acting in good faith and in the course of his professional practice only, may prescribe, administer and dispense narcotic drugs or he may cause them to be administered by a nurse or intern under his direction and supervision. Physicians and dentists are to keep a record of such narcotic drugs received by them and a record of all such drugs administered, dispensed or professionally used by them otherwise than by prescription. Uniform narcotic drug acts have been enacted in about fifteen other states. Both laws will be published in full in a coming issue of *Colorado Medicine*.

GEORGIA

Bill Passed.—H 230 has passed the house, proposing to amend those provisions of the medical practice act which require an applicant for a license to be a graduate of a legally incorporated medical college in good standing with the board by permitting graduates of one of the two colleges of medicine now existing in the state of Georgia also to qualify.

Bills Introduced.—H 918 proposes a new insurance code. Among other things, it proposes to permit any hospital or group of hospitals, not maintained by public funds, approved by the Georgia Hospital Association, the Georgia Medical Association, the American College of Surgeons or the American Medical Association, to form a nonprofit organization to provide hospitalization to the public, in consideration of weekly, monthly or annual dues. H 874, to supplement the chiropody practice act, proposes (1) that the joint secretary of the examining boards of Georgia act as joint secretary of the state board of chiropody examiners, (2) to provide that a member of the board may not be directly or indirectly associated or connected with any institution teaching chiropody, (3) to require all institutions in the state teaching chiropody to register the name of each student with the joint secretary not later than thirty days after the enrollment of that student and (4) to authorize the board to inspect and classify all institutions teaching chiropody.

ILLINOIS

Society News.—At a meeting of the Vermilion County Medical Society, March 6, Dr. Arthur H. Parmelee, Oak Park, spoke on "Respiratory Diseases in Children."—Dr. Chauncey C. Maher, Chicago, addressed the Whiteside County Medical Society, February 28, in Sterling on hypertension.—Dr. Harold O. Jones, Chicago, discussed "Diagnosis and Treatment of Carcinoma of the Cervix and Uterine Endometrium" before the Peoria City Medical Society, March 5.

Bills Introduced.—H 672 proposes to prohibit the retail sale or distribution of veronal, barbital or any of their salts, derivatives or compounds except on the prescription of a licensed physician, dentist or veterinarian. H 559 to amend the optometry practice act, proposes among other things, (1) to require applicants for licenses to be citizens of the United States or to have received their first naturalization papers, (2) to prohibit corporations from practicing optometry and (3) to prohibit advertising that in any way will tend to deceive or defraud the public the free examination of eyes or of fixed prices for optometric services. H 634 proposes to require employers to install exhaust systems for removing dust and dirt from grinding, polishing and buffing operations.

CHICAGO

Anniversary of Maimonides.—The eight hundredth anniversary of Maimonides was observed at a celebration at the Standard Club, March 24. The occasion was also an observance of the tenth anniversary of the opening of the Hebrew University in Jerusalem. Dr. Morris Fishbein, editor of *THE JOURNAL*, was chairman. Rabbi Solomon Goldman gave an address on Maimonides, and Drs. Nathan O. Ratnoff, Marcus Rothschild and Israel Strauss, New York, spoke on the medical department of the Hebrew University.

Vitamin D Milk Standards Adopted.—The Chicago Board of Health has recently adopted rules and regulations for the production and control of vitamin D milk. Three processes for this purpose have been accepted, including ultraviolet irradiation, the addition of an approved vitamin D concentrate in a satisfactory manner, and the feeding of concentrated vitamin D substances to dairy cows under suitable conditions. A series of regulation application forms and other data have been developed to guide those who wish to apply to the board for permits to distribute such milk in the Chicago area.

Banquet in Honor of Dr. Tice.—About 1,400 persons attended a banquet in Chicago at the Palmer House, March 23, to honor the long services of Dr. Frederick Tice, clinical professor of medicine, Rush Medical College, to the Cook County Hospital and the Municipal Tuberculosis Sanatorium. Dr. Frank Jurka, state health commissioner, Springfield, was toastmaster. Addresses were made by many public officials and also Drs. William A. Pusey, Samuel R. Slaymaker, Allan J. Hruby and Morris Fishbein. Dr. Tice is also emeritus professor of medicine at the University of Illinois College of Medicine.

IOWA

Bill Passed.—S 20 has passed the house, proposing that before any applicant for a license to practice medicine, osteopathy, osteopathy and surgery or chiropractic may be examined by his professional board he must first pass an examination before an impartial basic science board in anatomy, physiology, chemistry, pathology, bacteriology and hygiene.

Bills Introduced.—S 220, to amend the chiropractic practice act, proposes (1) to define chiropractors as persons who treat human ailments by the adjustment by hand of the articulation [sic] of the spine or by other incidental adjustments calculated to remove any cause and/or effect of any nerve interference, who may use in connection therewith, physical, mechanical, hygienic and sanitary measures, and (2) to provide that a license to practice chiropractic shall not authorize the holder thereof to practice operative surgery, osteopathy, nor to administer or prescribe any drug or medicine included in materia medica. S 250 and H 383 propose to authorize the board of supervisors of any county to make contracts with licensed practitioners of the healing art for the care of the indigent sick of the county. S 256 and H 378 propose to prohibit public nurses from favoring any particular branch of the healing art or from discriminating against any practitioner. H 329 proposes to amend the law according hospitals treating persons injured through the fault of others liens on all claims, judgments, settlements or compromises accruing to the injured persons by reason of their injuries, by according the lien also to physicians who have treated such persons. H 396 proposes to require insurance companies to recognize any required report or statement or notice relative to an insured person when furnished by any licensed practitioner of the healing art.

Society News.—Speakers before a meeting of the Tri-County Medical Society (Henry, Washington, Jefferson) in Mount Pleasant, February 28, were Drs. Walter D. Abbott, Des Moines, "Peripheral Nerve Injuries", Arthur W. Erskine, Cedar Rapids, "Common Fractures of Wrist Joint," and Oliver J. Fay, Des Moines, "What of Your Economic and Professional Future?"—Dr. Frederick H. Falls, Chicago, discussed "The Early Diagnosis and Treatment of Carcinoma of the Uterus" before the Black Hawk County Medical Society, February 19.—Dr. Lee W. Dean, St. Louis, will speak before the Linn County Medical Society, April 11, in Cedar Rapids. His subject will be "The Diagnosis and Treatment of Nasal Sinus Disease in Infants and Young Children."—At a meeting of the Cass and Audubon county medical societies in Atlantic, February 27, speakers included Dr. Matthew E. O'Keefe, Council Bluffs, on "Intestinal Obstruction Secondary to Acute Infections."—Dr. Joseph L. Stech, Council Bluffs, among others, addressed the Clarke County Medical Society in Osceola, February 5, on "Management of Head Injuries."—Speakers before the Fremont County Medical Society in Hamburg, February 13, included Dr. Donald J. Wilson, Omaha, on "Common Lesions About the Mouth and Mucous Membranes."—The Hardin

New York City

Personal—Dr Leona Baumgartner has been awarded the prize of the New England Pediatric Society for the best paper presented last year by fourth year medical students in New England on a subject of scientific interest in connection with the health of children. Dr Baumgartner's subject was "Age and Antibody Production." She graduated in June 1934 from Yale University School of Medicine, New Haven.

Society News—A symposium on angina pectoris with special reference to coronary artery disease was presented at the stated meeting of the New York Academy of Medicine, March 7, by Drs Harold M. Marvin, New Haven, Conn., Emanuel Libman and Harlow Brooks.—Dr Alfred W. Adson, Rochester, Minn., among others, addressed a joint meeting of the New York Neurological Society and the section of neurology and psychiatry of the New York Academy of Medicine, March 5, on "Malignant Hypertension: Results Obtained by Sympathectomies and Rhizotomies."—The Medical Society of the County of New York held an open forum, March 28, for the discussion of "The Future of Medicine." Speakers were Drs Morris Rosenthal, Frederic E. Sondern, Haven Emerson and Samuel J. Kopetzky.—Dr Frederic E. Sondern addressed the Bronx County Medical Society, February 20, on national health insurance in England.—Dr Ralph Colp addressed the New York Surgical Society, February 27, on "The Relation of Cholecystitis to Pathologic Changes in the Liver."—Speakers at a meeting of the Kings County Medical Society, February 19, were Drs John A. Kolmer, Philadelphia, on "Immunity and Vaccination Against Acute Anterior Poliomyelitis," and LeGrand Kerr, Pediatrics in the Gay Nineties.—Dr John C. MacEvitt, on behalf of alumni of St. Mary's Hospital presented to the society a portrait of Dr John Byrne, who became a member of the society in 1858. Dr Byrne was president of the New York Obstetrical Society in 1874 of the Brooklyn Gynecological Society, 1890, and of the American Gynecological Society, 1892. He was one of the founders of the Long Island College Hospital.

NORTH CAROLINA

Bill Enacted—H 148 has become a law granting to physicians and hospitals treating persons injured through the negligence of others liens on all sums recovered as damages by the injured persons by reason of their injuries.

Bill Passed—H 539 has passed the house, proposing to repeal the law requiring a male applicant for a marriage license either to sign an affidavit that he is free from venereal disease and active tuberculosis or to present a certificate from a licensed physician to that effect.

OHIO

Officers of State Board—Dr James G. Blower, Akron, was elected president of the Ohio State Medical Board at a recent meeting. Other officers elected are Drs John R. Shoemaker, Cuyahoga Falls, vice president, Louis T. Franklin, Chillicothe, treasurer, and Herbert M. Platter, Columbus, secretary.

Appointments at University of Cincinnati—Dr David A. Tucker Jr., associate clinical professor of contagious diseases at the University of Cincinnati College of Medicine, was appointed professor of the history of medicine at the February meeting of the board of directors. Dr George M. Guest was promoted to associate professor of pediatrics, among other changes. Dr Robert D. Maddox was appointed lecturer in military medicine and is giving a new course in that subject this semester.

Bills Introduced—H 307, to amend the sales tax law, proposes that a sales tax shall not be levied on the sale of medicine on a prescription issued by a licensed physician, when filled by a registered pharmacist.—H 497 proposes to establish, in the state department of health a bureau of social hygiene to reduce illegitimacy and to improve health and family conditions by the control of venereal diseases. The bureau is to be authorized to establish local clinics for the administration of free treatments for venereal diseases.

Fifty Years in Practice—Dr Florus F. Lawrence, Columbus was the guest of honor at a dinner given by his colleagues, March 7, in celebration of his completion of fifty years of medical practice.—Dr Wilson H. Button, Hubbard, recently celebrated the fiftieth anniversary of his graduation from Western Reserve University School of Medicine, Cleveland. Dr Button has practiced in Hubbard since 1896.—Dr James B. Hannah Addyston, marked the completion of fifty years of medical practice, March 5. Dr Hannah was graduated from the Medical College of Ohio, Cincinnati, in 1885.

OKLAHOMA

Bills Introduced—H 80, to amend the workmen's compensation act, proposes, among other things, to permit an injured employee to select at the employer's expense his own physician to treat his industrial injuries. H 207 proposes to exempt from the provisions of the insurance laws of the state all hospital associations engaged in the business of "indemnifying policy or certificate holders in said associations against the cost of medical surgical and hospital services and accommodations." H 425 proposes to prohibit the sale or other distribution, except by a licensee of the state board of pharmacy, of appliances, drugs or medicinal preparations intended or having special utility for the prevention of conception and/or of venereal diseases.

Society News—Drs Edward H. Skinner, Kansas City, Mo., and Wendell M. Long, Oklahoma City, discussed cancer and conducted clinics at a meeting of the Garfield County Medical Society, Enid, February 19.—Among speakers at a meeting of the Southern Oklahoma Medical Association, Ada, March 5, were Drs George L. Carlisle and Arthur J. Schwenkenberg, Dallas, Texas, on cardiac neurosis, James B. Eskridge Jr., Oklahoma City, female sex hormones, and Henry H. Turner, Oklahoma City, endocrine glands.—Physicians of Cherokee, Haskell, McIntosh, Muskogee, Okfuskee, Okmulgee, Tulsa and Wagoner counties participated in a joint meeting of the Muskogee, Tulsa and Okmulgee county medical societies in Muskogee, March 28. Speakers were Drs Isaac V. Bollinger, Henryetta, on silicosis, Walter S. Larrabee, Tulsa, disorders of the back, and Ira B. Oldham Jr., Muskogee, skeletal fixation in fractures.—At a meeting of the Carter County Medical Society, Ardmore, February 25, speakers were three Dallas physicians: Drs Ben R. Buford, on pellagra, Walter G. Reddick, differential diagnosis of conditions causing edema, and Dayton C. McBride, obesity.—Drs Jefferson R. Lemmon, Amarillo, Texas and Herbert L. Wright, Supply, among others addressed the Woodward County Medical Society, February 12, on "Pneumonia in Children" and "Purposes of the Allied Sciences," respectively.

OREGON

Endowment for Children's Hospital—The First Hebrew Benevolent Association of Portland recently gave to the Doernbecher Memorial Hospital for Children at the University of Oregon Medical School a fund of \$5,000 for maintenance of a bed in memory of the late Marx Cohen. The fund was left by Mr. Cohen to the association as a trust fund to be utilized for medical and surgical treatment of children under 16 who through poor financial circumstances would be unable to obtain such treatment.

PENNSYLVANIA

Hospital News—The secretary of the staff of the Center County Hospital, Bellefonte, has notified THE JOURNAL that Dr. Enoch H. Adams, Berwick, has not been made surgeon in chief to the Center County Hospital, as was reported February 16.

Bills Introduced—H 1521 proposes that all hospitals receiving state appropriations have in attendance at all times at least one licensed physician or resident intern who shall have graduated from an approved medical college. H 1604, to supplement the workmen's compensation act, proposes to make the following occupational diseases compensable: chrome ulceration, epitheliomatous cancer, ulceration of the skin or the corneal surface of the eye, chronic miners' asthma, silicosis, anthrax, infection or inflammation of the skin due to contact with oils, cutting compounds or lubricants, dusts, liquids, fumes, gases or vapors, and poisoning from lead, mercury, phosphorus, arsenic, methanol, carbon bisulphide, naphtha or volatile halogenate hydrocarbons, manganese dioxide, brass, zinc, benzol, nitro and amido derivatives of benzol, and radium.

Philadelphia

New Professorships—Three new clinical professorships have been established at the University of Pennsylvania School of Medicine and have been filled by the advancement of Drs Thomas Grier Miller, Richard A. Kern and Charles C. Wolferth from the rank of assistant professor. Dr Truman G. Schnabel, assistant professor of medicine, has been advanced to an associate professorship.

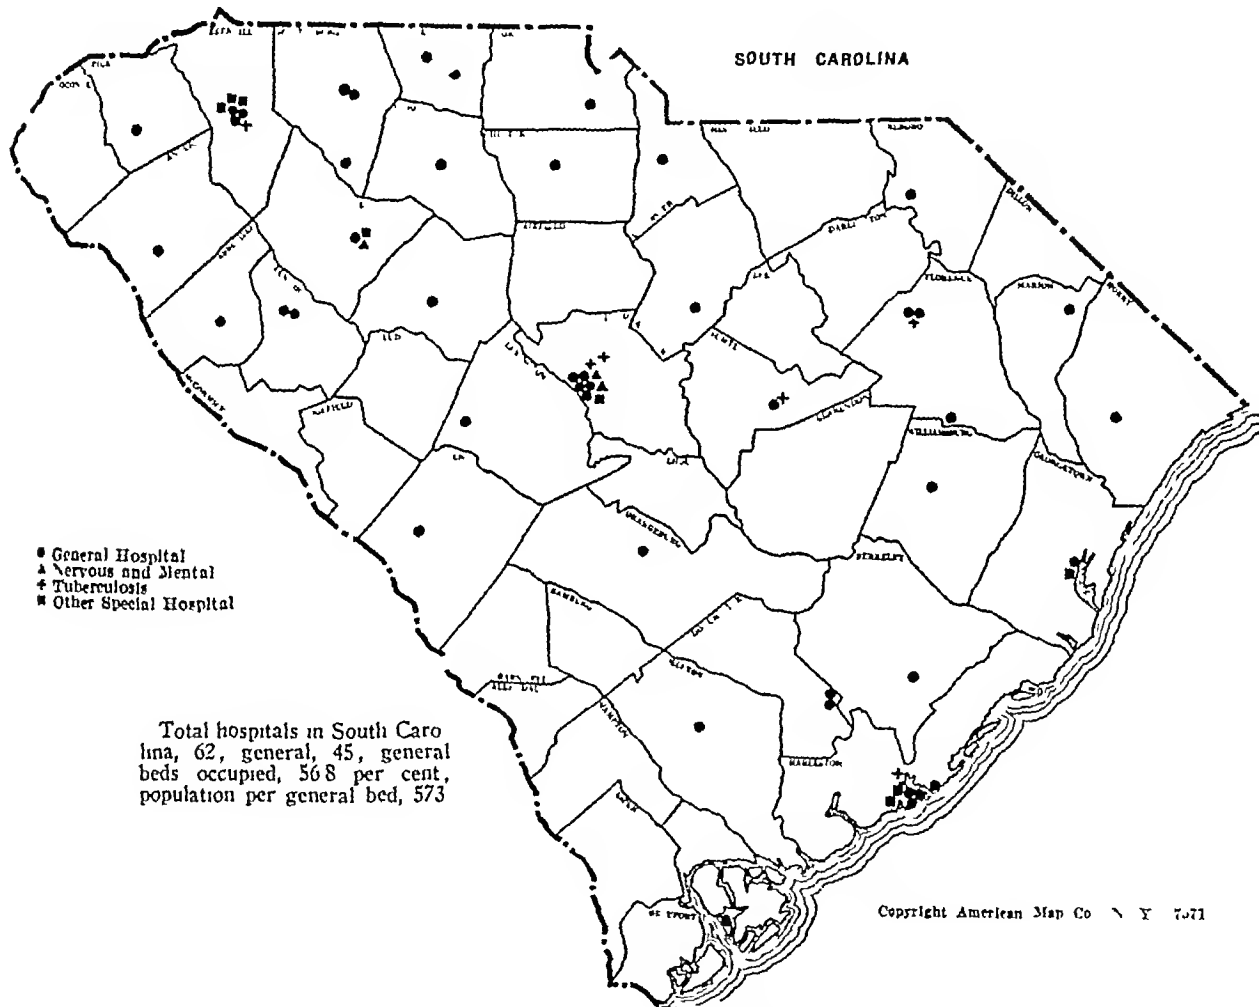

Personal—A portrait of Dr. Martha Tracy, dean of the Woman's Medical College of Pennsylvania, was presented to the college on its eighty-fifth anniversary, March 9. This is Dr. Tracy's twenty-fifth year at the college. Dr. Ellen C. Potter, Trenton, N. J., made the presentation. Dr. Helen Ingleby, professor of pathology, on behalf of trustees faculty,

Whither National Health Insurance?

In previous letters it has been shown that the further socialization of medicine is a primary object of the labor party and that the future of health insurance depends on whether that party again attains power, a danger that is generally admitted. In 1930, when this party was in power, the British Medical Association brought forward a scheme for a state medical service for the whole population. This great plunge into further medical socialism was not proposed because of any desire for it on the part of the profession or of the association but to forestall a possible scheme of the labor government. Soon afterward the prodigal finance of that government brought the country to the brink of ruin. There was a first class financial crisis and the pound crashed. The crushing defeat of the labor party followed and removed the danger—for a time—and no more has been heard of the association's scheme. At the recent annual conference of the labor party the national executive committee of the party submitted a report stating that there are grave defects in the panel system as regard both the type and the standard of medical care. The committee proposes that medical benefit should be taken away from health insurance altogether and that the insured should receive only cash benefit. It would enlarge the insurance scheme by including nonmanual workers with incomes up to \$2,500. But the insured would look to the local authorities for medical care, both at home and in the hospital. This would be provided at public expense. The committee visualizes a system of clinics, which would be 'well equipped surgeries where the patient would receive the best examination, diagnosis and treatment, without the interminable periods of waiting of the average hospital outpatient department'. Around these clinics would revolve domiciliary attendance and other facilities of the public health service. The medical profession would thus become officials employed by and paid by the state.

It is interesting to compare this program with that of the Medical Practitioners' Union. As stated in *THE JOURNAL*, January 19, page 228, this body is a medical trade union, which recently affiliated with the Trade Union Congress. The medical secretary of the British Medical Association declared in a press interview that the object was "to anticipate the political movement in the country," by which he must have meant the return to power of the labor party. The Medical Practitioners' Union can therefore now be described as a constituent of the labor party. In its organ the *Medical World* it has published a lengthy memorandum advocating extension of the general practitioner service of the insurance system to the whole population. The union 'expects that private practice will continue to exist although it will be considerably restricted'. In a universal service of this kind there will be no place for any contributory system for purely medical purposes' which exists at present. But the union does not want to abolish contribution for sickness benefit (that is, the payments made to sick members), which could be regarded as one form of unemployment benefit and part of a wider problem than the problems with which the medical profession is concerned. As much of the present contribution as is applied to the provision of medical benefit should cease. Whence the money for the payment of medical benefit is to come, the union does not condescend to say. It can only be from the taxpayer, who in the view of this socialist body is a beast of burden that does not even deserve to be mentioned for the service to be put on him.

It is thus evident that the future of the insurance system is bound up in the much greater question of the future of the political situation. If the labor party should again return to power, the system will certainly become more socialistic. Probably, as suggested, medical benefit will become noncontributory and therefore free and also will be extended to the whole population. The medical profession will for the most part be state paid, if indeed its members do not become mere state officials. The British Medical Association will resist this last proposal, as its policy has always been to protect private practice against the encroachments of official practice and if on no other point the Medical Practitioners' Union will be in agreement, for it is in favor of "free choice of doctor." But what the socialist politicians may decide is another matter. There of course would still be the luxury of private practice for persons who could afford to pay for it. But they would be a disappearing class. They are already disappearing under oppressive differential taxation. An official table, just issued, shows that the number of persons with incomes exceeding \$10,000 in 1932-1933 was 84,175, the lowest for six years, the highest was in 1929-1930, when the figure was 108,532. The main cause of the excessive taxation is socialistic expenditure.

Foreigners Must Be Naturalized Ten Years Before Beginning to Practice Medicine

In the *Concours medical* of February 17 appears the draft of a bill introduced in the French house of representatives by Mr. Dommange, which will place a serious obstacle in the path of any physician of foreign birth who seeks to practice in France. In July 1934 a bill was passed and became a law to the effect that naturalized citizens could not be admitted to the bar or occupy any official position until ten years had elapsed since their becoming French citizens. The Dommange bill proposes to extend this ten year period to the medical profession in order that a physician shall during such interval become thoroughly familiar with the language and customs of the country in which he intends to practice. This proposed law is in line with the recent agitation on the part of the medical students against the constantly increasing number of foreigners in the schools and hospitals of France.

Foreign Medical Students and Physicians in France

The editor-in-chief of the *Presse medicale*, Dr. Desfosses, discussed foreign medical students and physicians in France in the February 16 issue. France has always been liberal in admitting foreign students to its medical schools. An honorary diploma, or "diplome universitaire," which did not entitle the holder to practice medicine in France has been popular with foreigners who intended to practice in their home countries. Since the war, and particularly since the limitation of students in eastern Europe, the "non-Aryan" agitation in Germany and the raising of standards for admission in the United States and other countries, a large number of foreign medical students have matriculated in the French medical schools. A treaty with Rumania, dating back to 1860, enabled students to matriculate without even being required to present a bachelor of arts degree, such as is indispensable for French students. Some of the foreign students who matriculated only with the idea of receiving an honorary degree have been able to convert it into a state license which permits them to remain in France. The number of licenses to practice in Paris granted to foreigners is gradually increasing in proportion to those given to French citizens. The French medical schools are overcrowded, so that native students find it difficult to attend lectures and to work in the laboratories and dissecting rooms.

A few years ago, Professor Unterberger in Königsberg published the observation that boy babies could be secured through alkalization of the vaginal secretion, an announcement that caused a sensation in the columns of the daily papers. Extensive clinical observations and experiments on man or animals, concerning which Dr. Schumacher recently addressed the Giesesen Medical Society, have shown that Unterberger's contention is not confirmed. Schumacher studied clinically more than 1,500 pregnant women. He proved that the observation of the Cologne gynecologist Professor Füh, made in a small number of cases and constantly cited in support of Unterberger's contention, cannot be substantiated. It had been maintained that in the presence of a strongly acid reaction of the vaginal secretion girl babies and in the event of an alkaline reaction boy babies predominate. The fact is that male births predominate over female births with all degrees of vaginal secretion. Since the clinical tests lent no support to the Unterberger theory, Schumacher and Günther conducted experiments on 200 female mice and 100 female rats without confirming this theory. In experiments on rabbits, in ninety litters with 514 young, alkalization of the vaginal secretion before copulation could not be shown to exert any influence on the sex. In a few rabbits, to be sure, the theory appears to find support, but in an equal number of other female animals the opposite was true. If one combines the results of the various progenies, one gets a final figure that appears to support the Unterberger theory. The predominance of males, after alkalization of the vaginal secretion of the mothers, is, however, too slight and the results of the experiments are too contradictory to justify one in drawing any definitive conclusions. Also the other figures, taking into account the laws of variations, must be regarded as due to accidental circumstances.

A practical application of this method in man is fraught with danger, since it is possible, through a chemical alteration of the vaginal secretion, to cause damage to the offspring.

The attempts to influence the sex of the fetus by treating the mother animals with sex hormones have only theoretical interest as yet and require clarification by systematic experiments on animals.

RIO DE JANEIRO

(From Our Regular Correspondent)

Jan 15, 1935

Staphylococcus Toxin

Dr. J. Travassos, in a recent lecture, said that staphylococcus toxin has a marked antigenic power. The blood serum of animals that have been repeatedly inoculated with small doses of toxin by the subcutaneous and intradermal routes is manifestly antitoxic. Immunization by the intravenous route is difficult because the animals, as a rule, do not withstand the inoculation of increasing doses of the toxin. The antitoxin experimentally obtained by the speaker neutralizes both *in vitro* and *in vivo* all the toxic properties of the toxin. Animals actively immunized in the speaker's experiments resisted lethal doses of toxin by intravenous inoculation and proved to be immune to intradermal inoculation of certain doses of toxin that would produce extensive necrotic lesions in nonimmunized rabbits. The speaker's results prove the preventive power of antitoxin in relation to the lethal and necrotic action of filtrates. Antitoxin protects rabbits and guinea-pigs against the effect of the toxin. The protection lasts for a certain time, which varies according to the dose of antitoxin and the route of its inoculation. Staphylococcus antitoxin has a marked preventive power against the effect of the toxin but a limited curative power. The transocular and cisternal inoculation of 100, 200 or 300 units of antitoxin failed to restore the equilibrium in nine out of ten guinea-pigs inoculated five minutes after the onset of the syndrome. The action of staphylococcus antitoxin probably is

similar to that of tetanus antitoxin. The limitation of their curative action in both cases, regardless of their neutralizing effect on free toxins in the brain, is due to the fact that nerve cells more or less injured are unable to regain their integrity. Antitoxin might have a curative action in subacute intoxications of low evolution by neutralizing a small amount of toxin, as it is formed in nonextensive foci.

Gastrectomy for Duodenal Ulcer

Dr. Piragive Nogueira of the Faculty of Medicine of São Paulo emphasized in a lecture the satisfactory results of gastrectomy in the treatment of duodenal ulcers, either complicated by the presence of adhesions to the head of the pancreas or perforated at this site. Injury of the common bile duct during gastrectomy is rare (four cases in 1,000 operations). The injuries were successfully corrected by the creation of anastomosis between the common bile duct and the duodenum in three cases, and by an end to end anastomosis of the common bile duct in one case. In two cases the retroduodenal part of the common bile duct formed an angle, the vertex of which was at the base of the ulcer. In a case of duodenal ulcer at a lower site, where it perforated into the head of the pancreas, the canal of Wirsung was injured, resulting in acute necrosis of the pancreas, verified at necropsy.

Test of the Hypophysis in Hyperthyroidism

Drs. Mario Yahn, E. de Aguiar Whitaker and Celso Pereira da Silva recently discussed the value of the test of the hypophysis (injection of 1 cc. of extract of the posterior lobe of the hypophysis) described by Claude, Baudoin and Porak, in the diagnosis of hyperthyroidism. A group of seventeen persons, including eleven patients suffering with hyperthyroidism and six persons without it, were subjected to the test. The results were interpreted by the determination of the basal metabolism. The authors give the technical details to be followed in the test, as well as the criterion for the interpretation of results (either positive or negative). Positive results were obtained in five out of the group of eleven patients suffering with hyperthyroidism and in three of the persons without it. Claude, Baudoin and Porak reported positive results from the test in the whole group of patients with hyperthyroidism and negative results in the whole group of persons without it (thirteen and four cases, respectively). Yahn and his collaborators believe that these results may be due merely to chance and conclude that the test has no value for the diagnosis of hyperthyroidism.

Marriages

HARRY GOFF THOMPSON, Mount Vernon, Ill., to Miss Margaret Matthews of New Haven, Conn., Dec. 1, 1934.

JOHN J. FLANAGAN, Newark, N. J., to Miss Helen Patricia Froehlich of Glen Ridge, February 21.

SAUL H. KAPLAN, Canandaigua, N. Y., to Miss Ada Schneider of New York, March 3.

JAMES A. HARPER JR., to Dr. Edna K. Sexsmith, both of Greenfield, Iowa, Dec. 12, 1934.

JAMES JOSEPH ROWLAND, Highlands, N. J., to Miss Dorothy M. Alton of Detroit, March 2.

LACY JOHN SALAN, Washington, D. C., to Miss Marie Cecilia Rowan, Nov. 17, 1934.

MARTIN T. MEYERS to Miss Marjorie Marvin Wyley, both of Atlanta, Ga., February 27.

HAROLD W. KESCHNER to Miss Evelyn Clarice Silver, both of New York, March 14.

SAMUEL G. SEINFELD to Miss Charlotte Lois Strumpf, both of Chicago, February 10.

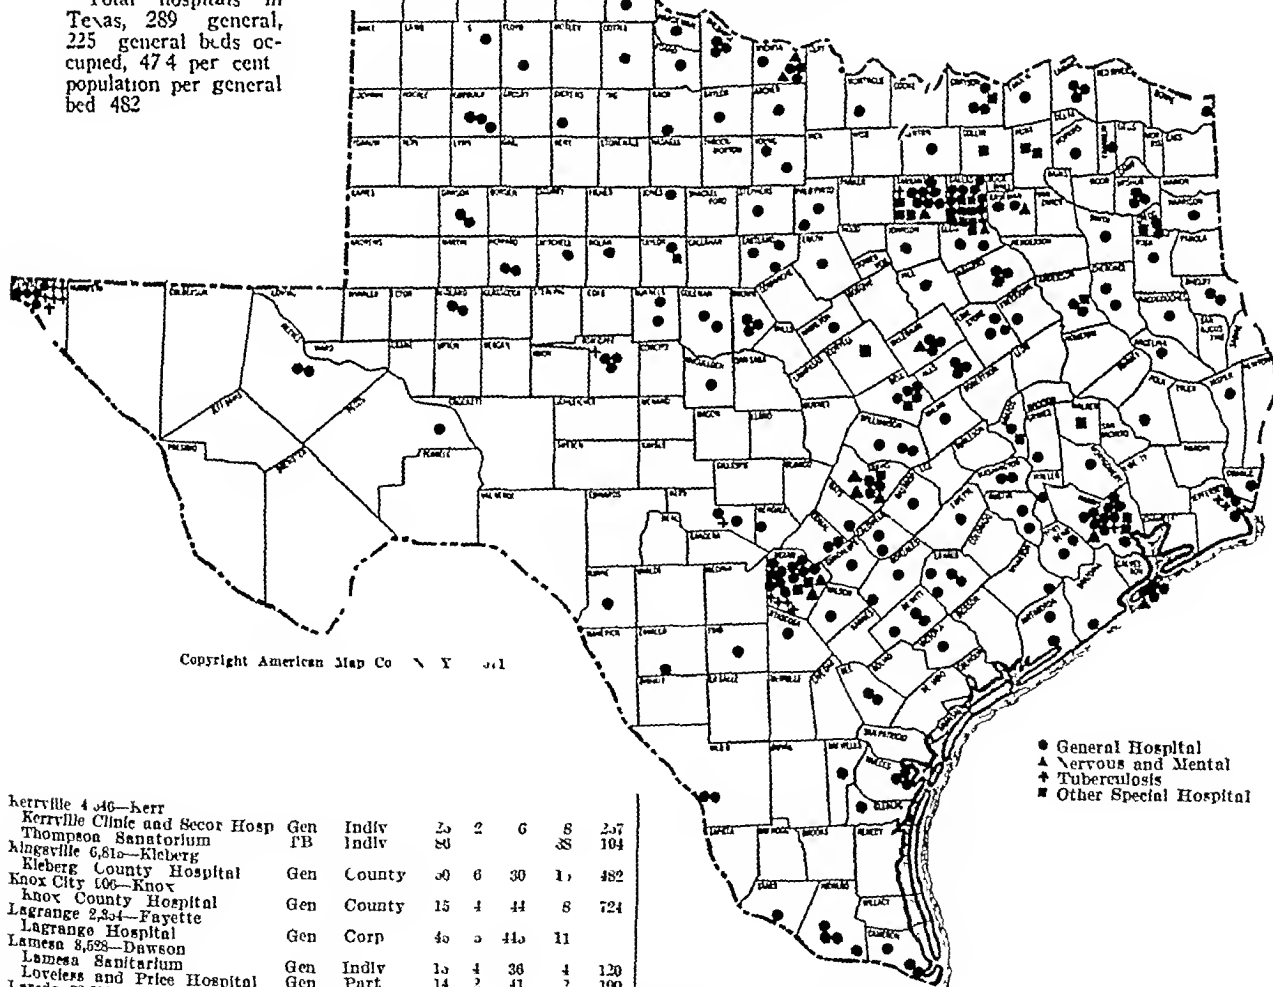

PAUL G. THODE, Chicago, to Miss Margaret Danielson of Evanston, Ill., March 5.

STANDARDIZATION IN TREATMENT OF BACILLURIA

To the Editor—Dr Crance in his article entitled "The Necessity for Standardization of the Treatment of Bacilluria" (THE JOURNAL, January 26, p 285) makes a definite advance by his recognition of the necessity of differentiating colon group bacilli into their two genera. This step is of such importance, especially in the evaluation of therapeutics, that it is greatly to be regretted that Dr Crance has not given information in regard to the bacteriologic details necessary for this differentiation. This cannot be done on the basis used by Dr Crance, i. e., the fermentation of sucrose. This test is employed for the differentiation of species of the genus *Escherichia*, of which our old friend *B. coli-communior* most familiarly represents the sucrose fermenting group and *B. coli-communis* the sucrose negative group (Zinsser, Hans, and Bayne-Jones, Stanhope A Textbook of Bacteriology, 1934, p 561). Only by use of the Voges-Proskauer and methyl red tests can the generic identification be finally made. The methods for these tests are to be found in any textbook of bacteriology. Dorner and Helinger (*J. Bact.* 29:16 [Jan.] 1935) give a comparison of methods recently developed for the Voges-Proskauer test. It has been my experience that a presumptive generic identification can be reached within twelve hours by the use of the citrate agar medium of Simmons (*J. Infect. Dis.* 39:309 [Sept.] 1926), which I have found to be invaluable, as species of *Escherichia* do not grow on this medium while species of *Aerobacter* grow rapidly and heavily. It is necessary to confirm this presumptive identification with the Voges-Proskauer and methyl red tests because of the rare citrate intermediate forms. The differentiation may be most clearly summarized as follows:

Genus	Voges Proskauer Test i. e. Production of Acetyl Methyl Carbinol	Methyl Red Test	Growth on Citrate Agar
<i>Escherichia</i>	0	+	0
<i>Aerobacter</i>	+	0	+

It has been found in this clinic that 44 per cent of colon group urinary infections are due to species of *Aerobacter* (*J. Bact.* 17:205 [March] 1929). In colon group blood stream invasions, the incidence of *Aerobacter* jumps to about 70 per cent. Moreover, the resistance of *Aerobacter* to drugs is much higher than that of *Escherichia*. For example, mercuric chloride in broth inhibits the growth of *Escherichia* in a dilution of 1:500,000, but 1:30,000 is required to inhibit the growth of *Aerobacter*. Therefore, while we no longer consider the specific identification of colon group bacilli of clinical value, we are glad to find recognition of the importance of generic identification.

JUSTINA H. HILL, M.S., Baltimore.

Bacteriologist, the James Buchanan Brady
Urological Institute, Johns Hopkins University and Hospital

AMERICAN STANDARD INSURANCE CORPORATION

To the Editor—The American Standard Insurance Corporation of Indianapolis is circularizing New York physicians with a letter beginning "Will you accept our Physicians' Non-cancellable Full Lifetime Income Policy for TWO FULL WEEKS—at our risk and expense?"

It should interest all physicians receiving this circular material to know that the *New York Medical Week* for Nov. 10, 1934, published a report on this company's financial status as of Dec. 31, 1933, obtained from the Indiana State Insurance

Department by Dr. A. M. Rabiner of Brooklyn. Prospective clients looking forward to full lifetime non-cancellable income policy will judge for themselves as to the resources backing up these promises.

Capital	None
Income	\$19,197.27
Disbursements	20,053.36
Assets	6,562.51
Liabilities	1,039.36
Balance	5,523.15

RAMSAY SPILLMAN, M.D., New York.

COMMENT—A large number of requests have been received for information concerning the American Standard Insurance Corporation of Indianapolis. When one compares the financial standing of the American Standard Insurance Corporation, with no capital, admitted assets of something over \$6,000 and liabilities of \$1,000, with other well established companies the comparison is most unfavorable to this company.

Queries and Minor Notes

ANONYMOUS COMMUNICATIONS and queries on postal cards will not be noticed. Every letter must contain the writer's name and address but these will be omitted, on request.

ACCURACY OF TESTS FOR SYPHILIS

To the Editor—I should like to know the opinion as to the relative value of accuracy of a Kahn, Wassermann and Hinton serologic test for syphilis. Please omit name.

M.D. Texas

ANSWER—The relative accuracy of different tests for syphilis in this country will soon be evaluated under the auspices of the U. S. Public Health Service, jointly with the American Association of Clinical Pathologists (The Evaluation of Serologic Procedures for the Diagnosis of Syphilis, editorial, THE JOURNAL, Oct. 29, 1934, p 1237. Cumming, H. S., Hazen, H. H., Sanford, A. H., Senear, F. E., Simpson, W. M., and Vonderlehr, R. A. The Evaluation of Serodiagnostic Tests for Syphilis in the United States, *ibid.*, Dec. 1, 1934, p 1705). Approximately 1,000 comparable specimens of blood and spinal fluid will be submitted to authors of different methods or modifications from about December 1934 to March 1935 for serologic examination. Each worker will utilize only one designated method. The final results, to be submitted to the U. S. Public Health Service, should indicate which method is the most satisfactory. Meanwhile the important criteria available for judging Kahn and Wassermann tests are summarized in two reports by the League of Nations (League of Nations, Health Organization, Conference on Serodiagnosis of Syphilis held at Copenhagen, Geneva, 1928, Conference on Serodiagnosis of Syphilis held at Montevideo, Geneva, 1930). The report of the Montevideo conference refers to the Kahn reaction as being "absolutely specific and extremely sensitive" and superior to the Wassermann tests used at both conferences. Since the completion of those conferences, Wassermann procedures have generally been improved on and new precipitation methods have been presented. Reports on the Hinton test are comparatively limited in number. Burdon and Duggan (*Am. J. Syph.* 17:110 [Jan.] 1933) obtained comparable results with the Hinton and Kahn tests. A highly reliable Wassermann technique should compare favorably with either one of these two precipitation methods.

TOXICITY OF HEMATOPORPHYRIN

To the Editor—The question has been asked me whether the mode of murder in a recent murder story was possible and I must ask you. The victim was given hematoxylin and death occurred when he went out into the sunshine. Would it be possible for one to get sufficient hematoxylin for that to occur? I doubted it but could not be sure. Please omit name.

M.D. Louisiana

ANSWER—Observations on animals as well as on human beings indicate that hematoxylin may cause serious symptoms and even death under certain conditions. When mice are given hematoxylin by subcutaneous injection and then exposed to light, the skin will become livid or red and death will occur sooner or later from failure of respiration and fall in the blood pressure (Hausmann, W. Die sensibilisierende Wirkung des Hämatoporphyrins, *Biochem. Ztschr.* 30:276 1911). A boy, aged 3 years, was injected intramuscularly with 0.12 Gm of hematoxylin in 80 cc. of weak solution of sodium hydroxide. Two and one-half hours later he was

TREATMENT OF TABETIC PAINS

To the Editor—In case of tabes dorsalis in a woman aged 50 of a number of years duration having had antisyphilitic treatment years ago and at present a negative blood and spinal fluid Wassermann reaction, what is the best analgesic for the relief of severe lightning pains of the extremities (morphine nauseates coal tar products take too long)? What may be used in place of intravenous trypanamide when the veins are too small (she is receiving iodohistitol and iodides)? Please omit name.

M D New York

ANSWER.—From the question it is judged that the pains are so severe as to make life unbearable. Consideration may then be given to the use of such measures as the epidural (not intradural) injection of physiologic solution of sodium chloride, with or without the addition of small amounts of procaine hydrochloride. Sometimes these will result in prolonged remissions. When the pain is so severe as to cause exhaustion it may be necessary to resort to division of the pain tracts in the cord, either by chordotomy or by division of the posterior commissure. These are dangerous procedures and must be carried out by an experienced neurosurgeon. There are no substitutes for trypanamide that can be administered orally. Consideration might be given to the use of pyretotherapy; the results of which are variably reported.

INSOMNIA IN AGED

To the Editor—A woman aged 86 is suffering with chronic insomnia. Once she gets a good night's sleep she is up and about the next day feeling fine. Without a good night's sleep she is miserable the whole day. She has a chronic myocarditis and a chronic gastritis of some sort and gets along well on a milk and egg diet though there is no definite evidence of ulcer of the stomach. The blood pressure is 160 systolic 90 diastolic. There are no other significant physical manifestations. She requires large doses of hypnotics, 80 grains (5 Gm.) of sodium bromide does not avail. It takes 9 grains (0.6 Gm.) of sodium amylal or oriol to put her to sleep for several hours and she has to have it every night. Kindly suggest the best thing to do in this case. Please omit name.

M D New York

ANSWER.—Treatment for insomnia in the aged is always a difficult and individual problem. It may be necessary to continue the use of the hypnotics that are found to be efficacious. Sometimes small doses of alcohol will produce the desired effect. This treatment may be combined with advantage in some cases with paraldehyde. It is assumed that attention has been given to general hygienic measures and predormital occupation.

UNION OF SKULL SUTURES IN INFANT

To the Editor—In Queries and Minor Notes in THE JOURNAL, December 29, 1934, page 2046, you answered an M D from California on the question of premature osseous union of skull sutures in a 10 weeks old infant. You stated that this was probably secondary to failure of brain growth and led to the group called microcephalic. I am sure you are correct in this statement but I do not feel that the question was fully answered.

It is known that oxycephaly and acrocephaly, which are due to premature synostosis of the sutures, can lead to feeble-mindedness (Bronfenbrenner A N. Oxycephaly as a Pathogenic Entity. *Am J Dis Child* 42: 837 [Oct.] 1931) also that the condition if found early enough may be amenable to surgical intervention (Gilman in Cabot Case Reports *New England J Med* 204: 274 [Feb 5] 1931).

Although I know of no reports in infancy it is conceivable although very improbable that this mechanism may be at play in the questioned case. The M D should be able to rule out this remote possibility by:

1. Feeling of the sutures which at this age are open giving a flexibility to the skull plates.
2. A fundus examination.
3. A lumbar puncture.

POSSIBLE HYPERINSULINISM

To the Editor—In answer to a query of a Texan physician entitled Vomiting in Childhood, which appeared in THE JOURNAL, January 26, the differential diagnosis included recurrent or cyclic vomiting, allergic reaction or overfeeding and appendicitis. The syndrome as given was of a well boy aged 6 years who while playing suddenly goes to his mother, complains of nausea, vomits, then becomes completely relaxed and pale and has a bowel movement. This is followed by a short sleep of two or three hours following which the child is apparently well. If these symptoms follow close on one another in approximately the same sequence each time the child has an attack and the whole picture covers a comparatively short period of time every month or so I think it is well to consider also in this case a type of petit mal or possibly a so-called epileptic equivalent. Because of the voracious appetite it would be well to exclude a possibility of hyperinsulinism. The child may have enough dextrose to keep all symptoms in abeyance until he overexerts himself such as in playing and running about when he may develop a temporary hypoglycemic state.

MICHAEL A. BRESCIA, M D Queens N Y

Medical Examinations and Licensure

COMING EXAMINATIONS

AMERICAN BOARD OF DERMATOLOGY AND SYPHILOLOGY. Written (Group B candidates). The examination will be held in various cities throughout the country April 29. Oral (Group A and Group B candidates). New York June 10. Sec. Dr C Guy Lane, 416 Marlborough St. Boston.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY. Final oral and clinical examination (Group A and Group B candidates). Atlantic City N J June 10-11. Sec. Dr Paul Titus 1015 Highland Bldg. Pittsburgh.

AMERICAN BOARD OF OPHTHALMOLOGY. Philadelphia June 8 and New York June 10. Applications must be filed before April 10. Sec. Dr William H. Wilder 122 S. Michigan Blvd., Chicago.

AMERICAN BOARD OF OTOLARYNGOLOGY. New York June 8. Sec. Dr W P Wherry 1500 Medical Arts Bldg. Omaha.

AMERICAN BOARD OF PEDIATRICS. Atlantic City N J June 10 and St. Louis Nov. 19. Sec. Dr C A Aldrich 723 Elm St. Winnetka Ill.

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY. Philadelphia June 7-8. Sec. Dr Walter Freeman 1726 Eye St. N.W. Washington D C.

AMERICAN BOARD OF RADIOLOGY. San Francisco May 10-12 and Atlantic City N J June 8-10. Sec. Dr Byrl R. Kirklin Mayo Clinic Rochester Minn.

ARIZONA. Phoenix April 23. Sec. Dr J H Patterson 826 Security Bldg. Phoenix.

ARKANSAS. Basic Science. Little Rock May 6. Sec. Mr Louis E. Gebauer 701 Main St., Little Rock. Regular. Little Rock May 14. Sec. Dr A S Buchanan Prescott. Eclectic. Little Rock May 14. Sec. Dr L L Marshall 820 W. 14th St. Little Rock.

CALIFORNIA. Reciprocity. San Francisco May 15. Sec. Dr Charles B. Pinkham 420 State Office Bldg. Sacramento.

COLORADO. Denver April 3. Sec. Dr Wm. Whitridge Williams 422 State Office Bldg. Denver.

IDAHO. Boise April 2. Commissioner of Law Enforcement, Hon. Emmett Pfozt 203 State House Boise.

ILLINOIS. Chicago April 9-11. Superintendent of Registration Department of Registration and Education Mr Eugene R. Schwartz Springfield.

MINNESOTA. Basic Science. Minneapolis April 23. Sec. Dr J. Charnley McKinley, 126 Millard Hall University of Minnesota. Minneapolis. Medical. Minneapolis April 16-18. Sec. Dr E J. Engberg 350 St. Peter St. St. Paul.

MONTANA. Helena, April 2. Sec. Dr S A Cooney 7 W. 6th Ave. Helena.

NATIONAL BOARD OF MEDICAL EXAMINERS. The examination will be held in all centers where there are Class A medical schools and five or more candidates desiring to take the examination June 24-26. Ex. Sec. Mr Everett S. Elwood 225 S. 15th St. Philadelphia.

NEBRASKA. Basic Science. Omaha May 7-8. Dir. Bureau of Examining Boards Mrs. Clark Perkins State House Lincoln.

NEVADA. Carson City May 6. Sec. Dr Edward E. Hamer, Carson City.

NEW MEXICO. Santa Fe April 8-9. Sec. Dr P G Cornish Jr 221 W. Central Ave. Albuquerque.

OREGON. Basic Science. Portland May 18. Sec. Mr Charles D. Byrne University of Oregon Eugene.

RHODE ISLAND. Providence April 4-5. Dir. Department of Public Health Dr Edward A. McLaughlin 319 State Office Building Providence.

Florida November Examination

Dr William M. Rowlett, secretary, Florida State Board of Medical Examiners, reports the examination held in Tampa Nov. 12-13, 1934. Sixty candidates were examined, 39 of whom passed and 21 failed. The following schools were represented:

School	PASSED	Year Grad	Per Cent
College of Medical Evangelists	(1931)	79.4	
Yale University School of Medicine	(1931)	82

Our Heritage and Other Addresses By Colonel Hon Herbert A Bruce R.A.M.C. M.D. L.R.C.P. Lieutenant Governor of Ontario Cloth Price \$2.50 Pp 392 Toronto The Macmillan Company of Canada Ltd 1934

In chronological order Dr Bruce presents addresses delivered by him as lieutenant governor of Ontario from Dec. 31, 1932, through November 1934. The addresses cover almost every phase of human interest. Of particular medical interest are those on the romance of surgery, sterilization of the feeble-minded, cheaper convalescence, medicine acknowledges no national barriers, quacks versus science, cost of convalescence, the literary practices of some medical practitioners, and numerous addresses on such subjects as housing and education which are in the field of social medicine. The point of view of Dr Bruce is unusually sound and yet fairly advanced. He writes directly and simply. Unfortunately some of the addresses are pointed for the occasion on which they were given and will have but little interest for those who read them in this collection.

Medicolegal

Malpractice Baldness Attributed to Roentgen Treatment—The patient had a small sore on the crown of her head which the appellant physician diagnosed as favus. He administered three roentgen treatments to her head. As a result of the negligent administration of the treatments, it was alleged, the patient suffered a severe burn resulting in permanent baldness of most of her head. The father, as next friend of the patient, his minor daughter, sued the physician and obtained judgment in the trial court. The physician appealed to the court of civil appeals of Texas, Austin.

The physician contended that the baldness was due to the disease. He testified that the first treatment was for five minutes on the sore spot, the second for five minutes each on five different areas in the region of the sore spot, and the third for eight minutes on the sore spot. He and other experts testified that this was the proper method of roentgen treatment. The girl's parents who accompanied her at the time of each treatment, testified that the first treatment was from fifteen to thirty minutes, the second for one hour and a half, and the third for a longer period of time than eight minutes. After the second exposure, or treatment, according to the testimony, the girl's head began to turn red and blisters appeared. Later the head became as 'a piece of raw meat' and continued so for several months causing her great pain, and in the end sloughed off to the bone, leaving her bald. The testimony of the experts as to whether favus would cause complete baldness conflicted. Some testified that in extreme cases it would, while another testified that only the immediate hair involved would die. After examining the girl's head before the jury, one of the experts testified that her baldness was caused by a burn and that she would be permanently bald. The doctrine of *res ipsa loquitur*, said the court, is not involved in this case and under the evidence it was clearly a question for the jury to determine whether the injuries were caused by the physician's negligence.

The physician further contended that the court erred in permitting a picture from a medical textbook to be exhibited to the jury to test the weight to be given to the testimony of an expert witness called by him. This witness testified that a favus infection might produce complete or spotted baldness, depending on the extent and severity of the infection, and that the straight lines of demarcation of the bald and hairy portions of the girl's head were a mere coincidence, in that the infection of hair follicles happened to stop at the straight lines. On cross-examination, this witness testified that a certain textbook on roentgen rays was a standard authority. He was shown a picture in the textbook as typical of baldness caused by favus infection, which he said showed a moderate infection, because the patient had hair scattered over his head. Over objection, the picture was exhibited to and inspected by the jury. The rule is settled, said the court, that the knowledge and qualification of an expert witness may be tested as against accepted authorities on the subject testified about. The same rule should apply to a picture as to the written text.

There was sufficient evidence, the court said, that the girl would suffer physical discomfort in the future because of her baldness, and the trial court did not err in submitting such discomfort as an element of damages suffered by her. The judgment of the trial court was affirmed.—*Hess v Millsap (Texas)* 72 S. W. 2d 923

Repeated Attacks of Experimental Pneumococcus Pneumonia—Coggeshall and Robertson studied the effects of repeated attacks of lobar pneumonia produced by the intrabronchial injection of pneumococcus type I in twenty-five dogs undergoing seventy-eight infections induced at intervals of from three days to nineteen months. The number of attacks to which animals were subjected ranged from two to eleven. The dogs were killed during the final infection and the pulmonary pathologic changes were studied. That recovery from the experimental disease conferred on the animal increased resistance against subsequent infections was shown by the fact that such animals regularly survived doses of culture which in the dog infected for the first time produced a fatal outcome. The recurrent attacks of pneumonia were uniformly mild in character; the febrile course was brief, the pulmonary lesion was usually confined to a single lobe and bacteremia seldom occurred. The time intervals between attacks bore no relationship to the severity of the experimental disease. Tests for acquired antipneumococcus immune substances in the blood after recovery showed their presence in some animals and not in others; yet dogs without demonstrable humoral immunity appeared to be just as resistant to reinfection as those possessing it. Secondary lesions produced in the lobe previously affected tended to evolve much more rapidly than did the primary ones. They were characterized by the early appearance of a generalized macrophage reaction and a marked diminution in the numbers of pneumococci in the tissues or their complete absence. These changes occurred more slowly in secondary lesions initiated in heretofore uninvolved lobes. The macrophage reaction which consists of a swelling of the fixed tissue cells (histiocytes) and a subsequent liberation of macrophages into the alveolar exudate, is regarded as a significant evidence of increased antipneumococcus resistance, since it has been observed to occur regularly at the time of recovery from the first infection and is accompanied by the local disappearance of the invading micro-organisms.

Tests for Hypersensitiveness After Recovery from Experimental Pneumonia—Coggeshall bases his conclusion that dogs do not develop hypersensitivity to the pneumococcus as the result of experimental lobar pneumonia on the following: 1 Fifteen dogs were given type I and II pneumococcus lobar pneumonia and following recovery, were tested for hypersensitiveness by means of intrabronchial and intracutaneous injections of the autolysate made from the homologous pneumococcus. 2 Seven dogs showed a pulmonary lesion discernible with the x-rays at the site of the autolysate inoculation; three of these dogs were normal controls. 3 No evidence of a positive skin reaction was found in any of the fifteen dogs; many of which received repeated infections and intradermal autolysate injections. 4 Subsequent infections in the same animals were

definitely milder than the initial infection. 5 The infections following the administration of intrapulmonary and cutaneous autolysate were of about the same intensity as the initial infection. 6 Temperature, pulse rates, white blood counts and differential blood pictures showed no significant variations following intrapulmonary injection of autolysate. 7 Tests for the acquisition of humoral immune bodies following autolysate injection and recovery from the experimental disease showed the presence of these substances in some of the dogs and their absence in others. 8 Study of the pathology of the pulmonary lesions produced by the autolysate failed to reveal histologic changes characteristic of an allergic reaction. However, the presence of perivascular accumulations of large mononuclear cells observed in the lesions of the recovered dogs does suggest a locally accelerated reactivity of the fixed tissue cells to the products of the pneumococcus.

Method for Analysis of Dust Samples—Bale and Fray believe that their method of employing x-ray powder spectroscopy promises to aid materially in the qualitative analysis of dust samples. The results of the test are available at the end of from twenty-four to forty-eight hours. The dust is very finely pulverized and inserted in a capillary glass tube. The properly filtered Ka radiation of a molybdenum target x-ray tube is used to produce a nearly monochromatic beam, which is passed through the contents of the capillary tube, producing diffractive effects identified on the film as bands of different density and intensity separated by areas of comparatively clear film. The blackening of the film occurs in bands, because these areas represent directions in which reinforcement of the roentgen energy occurs from diffractive interference while the clear areas show little blackening, owing to the fact that these areas relate to the aphasical character of the roentgen energy diffracted in these directions. The quantitative amounts of sand or mica in a mixed dust sample of unknown character may be determined at least approximately by comparing the relative film densities of selected strong bands of the substance in the mixed sample with that of a known mixed control of the same substances.

bandage is left in position as long as it will adhere—usually, in the early stages when discharge is plentiful, from twelve to forty-eight hours. It is then replaced by similar pieces of adhesive plaster and repeated until healing is complete. On removal of the bandage no attempt should be made to clean the surface of the sore. It suffices to wipe away the discharge from the surrounding skin with absorbent cotton or a soft cloth before applying a new piece of bandage.

Infection with Yellow Fever Virus Following Instillation into Nares.—Findlay and Clarke state that the nasal instillation of neurotropic yellow fever virus in monkeys and mice is followed by the development of encephalitis; the virus also reaches the peripheral blood stream. The virus is present in the olfactory lobes of a monkey and in the cerebral hemispheres of mice two days after nasal instillation. Later there is a general spread throughout the brain. Instillation of the virus in the conjunctival sacs of mice is followed in certain cases by encephalitis. Monkeys that have immune bodies to yellow fever present in the blood do not develop encephalitis after nasal instillation of the virus. The possible routes by which the virus reaches the brain from the nasal cavities are discussed.

The Ectopic Testicle.—Vines examined histologically forty-four cases of ectopic testicles of which thirty-eight showed unilateral and six bilateral misplacement. Unilateral and bilateral ectopic testicles are histologically distinct at and after puberty; before puberty no constant differences have been observed in equally immature testicles. After puberty the unilateral ectopic testicle undergoes progressive atrophy involving first and chiefly the spermatic epithelium and later the interstitial cells. In bilateral ectopia complete testicular atrophy does not occur; there is either normal spermatogenesis or else the spermatic tissue atrophies while the interstitial cells undergo marked hyperplasia. The atrophy of the spermatic tissue which may occur in both types of ectopia, is a result of puberty. It is probably due to the incapacity of the immature testicle to respond successfully to the stimulus of puberty. The interstitial hyperplasia in bilateral ectopia is also an effect of puberty and does not occur in the prepubertal period. The author suggests that bilateral ectopia and its associated malformations of the genitalia are not governed by the gonad but are parts of an endocrine syndrome that causes masculinization of the female in early fetal life.

 *Hernias of Mediastinum and Their Pathogenesis F Triboulet and J Lecœur—p 156

Besnier-Boeck's Disease.—Pautrier discusses in detail the clinical and pathologic manifestations of multiple benign sarcoma in various tissues. The cutaneous lesions, which have been the longest known, appear as nodosities of varying sizes. They develop slowly during years and may leave a central scar. The histologic picture is characteristic. They are formed of a dermal infiltration predominantly epithelioid and separated by narrow bands of collagen. Histiocytes and lymphocytes are frequently present. The infiltrating nodules border the hypoderm without producing the least reaction. The lesions in the ganglions, tracheobronchial glands, lungs, osseous tissue, viscera and nasal and conjunctival mucosa are histologically identical. The condition is therefore revealed as a generalized systemic disease primarily reticulo-endothelial. No agreement as to etiology has been reached. The consensus allies it with tuberculosis in an attenuated form. The author employs a treatment consisting of tuberculin and neoarsphenamine and has obtained many good results with it.

Hernias of Mediastinum.—Triboulet and Lecœur discuss the anatomic and functional factors concerned in mediastinal herniation. Two cases are reported. As a result of their studies they conclude that the pathogenic mechanism is not simple. It is usually due to pressing back of the pleural cul-de-sac through a weakened zone of the mediastinum owing to the simple influence of disequilibrium of pressures created by pneumothorax and manifesting itself through a maximum of expiratory distention. More rarely a different mechanism is involved in which the hernias are of maximum inspiration resulting from the aspirating action exerted by the opposite lung and are a simple manifestation of the retractable tendency of lesions at this site.

 *Prophylaxis of Measles with Adult Serum A S Levine—p 825

Prophylaxis of Measles.—Measles and its complications account for a high percentage of the infectious disease mortality. The struggle against measles according to Levine lies in the domain of general prophylaxis, hygiene and specific immunobiology. The immunizing action of adult serum may perhaps be explained in two ways: the presence of proteins and the presence of specific antibodies. He observed several groups of infants with various degrees of exposure and immunization to measles. He concludes that adult serum is a valuable prophylactic agent against measles. Convalescent serum has given brilliant results. Late introduction of serum has no results; early administration, even of small quantities, often is advantageous. The introduction of serum lengthens the period of incubation. Large doses of serum (60 cc.) given in the first

as well as by old patients and in administration into the muscle, the vein or the peritoneum he thinks that there is no reason to discontinue its use. He says that the considerable relief effected by salyrgan often induces the patients to request an injection.

Salyrgan as Diuretic in Severe Cardiac Weakness—According to Tziwanopoulos, most authorities agree that in severe cardiac insufficiency with a low maximum blood pressure and with myocardial changes a sudden artificial increase in the diuresis, which might cause a disturbance in the labile equilibrium of the circulation is to be avoided. He points out that the danger involved in the use of salyrgan in severe heart disease has been stressed repeatedly and that it has been recommended that the administration of salyrgan be preceded by a thorough digitalization.

Wiener klinische Wochenschrift, Vienna

48: 97 128 (Jan 25) 1935 Partial Index

- *Significance of Habit in Clinical Pathology F. Hamburger—p. 97
- *Clinical Aspects of Carcinoma of Head of Pancreas L. Hess and J. Faltingschek—p. 103
- *Histamine Action and Its Modifiability in Children G. Papp—p. 107
- *Irritating Diet F. Kauders—p. 109
- Influenza N. von Jagie—p. 113
- Treatment of Renovascular Tuberculosis T. Hrynschak—p. 114

Clinical Aspects of Carcinoma of Head of Pancreas—Hess and Faltingschek call attention to the fact that the neoplasms developing in the head of the pancreas because of their spatial relation to the large bile duct, the pancreatic duct and the duodenum, are characterized by a number of symptoms, the concurrence of which makes a diagnosis possible. They describe one case of carcinoma showing the triad of typical symptoms: mechanical icterus with continuous complete acholia, continuous melena and Courvoisier's sign. Then they describe another case, in which the same syndrome was caused not by carcinoma but by cirrhosis of the pancreas. From this observation they conclude that the classic triad of symptoms does not permit a definite diagnosis of cancerous stenosis of the bile duct as long as ascites is absent. But, although the triad of symptoms lacks complete conclusiveness as regards a malignant process in the region of the bile passages, the intermittence of the biliary occlusion does not, as was formerly believed, indicate always a lithogenic closure but may occur also in the occlusion that results from malignant processes. The authors report a case history to illustrate this. They point out that, because of the nearness of the head of the pancreas to the duodenum, passage disturbances in this portion of the intestine may develop as the result of pancreatic carcinoma. In this connection they relate the clinical history of a man in whom during the beginning period of the cancer, incomplete duodenal stenosis without icterus was the main symptom. On the basis of this symptom an ulcerating process of the duodenum had been assumed at first. The authors stress that in patients of advanced age in whom roentgenoscopy reveals changes in the duodenum, the possibility of an incipient malignant growth of the pancreas should not be overlooked.

Histamine Action and How It Is Modified in Children

—Papp studied the pharmacologic action of histamine in children. He observed the general condition, the cutaneous symptoms, the blood pressure, the pulse, the formation of gastric juice, the pupillary reaction and the urine. He administered subcutaneously from 0.25 to 1 mg. of histamine. He observed various degrees of erythema, particularly in the face and at the site of injection. Increase in the temperature, headaches and tremors developed in many children. The formation of gastric juice was always greatly increased. However, histamine influenced neither the pulse nor the blood pressure. The author tried to inhibit or modify the action of histamine by various substances. He found that the administration of hypophyseal extract influences the erythema continuously and that epinephrine and dextrose influence the erythema slightly. The acid solutions of sodium phosphate and of sodium carbonate exert a hardly perceptible influence, and the solution of calcium exerts only a weak influence. The stimulating action exerted by histamine on the formation of gastric juice remains uninfluenced by any of the substances. Solution of sodium hydrocarbonate seems to increase further the action of histamine on the gastric juice.

Hospitalstidende, Copenhagen

- *Plasma Phosphatase in Normal and Rachitic Children O. Andersen—p. 5
- *Acute Barbitol Intoxication with Especial Regard to Organic Degenerations J. Ravn—p. 19

Plasma Phosphatase in Normal and Rachitic Children—Andersen's investigations in thirteen children aged up to 3 years, and twelve aged from 3 to 13, all without signs of rickets, showed average plasma phosphatase values of 0.25 in the first group, with boundary values from 0.14 to 0.34, and of 0.15 in the second group, with boundary values from 0.06 to 0.26. In twenty-five children, aged from 3 to 27 months, with typical signs of rickets, the average value was 0.86, with boundary values from 0.42 to 1.41. The lowest limit for beginning pathologic values is set at 0.30. Antirachitic treatment in rachitic children results in a reduction of the plasma phosphatase the decrease being slow in comparison to the increase in calcium and phosphorus values and apparently following more closely the clinical improvement. No relation is apparent between the absolute phosphatase and calcium values, but a certain relation is seen between the phosphorus count and plasma phosphatase count, high phosphatase values usually appearing with low phosphorus values and vice versa. The absolute phosphatase value seems to be independent of the degree of the rickets. The establishment of increased phosphatase without simultaneous clinically demonstrable rickets may indicate latent D. avitaminosis. Determination of the plasma phosphatase may perhaps be applied in confirming the optimal dose of vitamin D in the treatment of rickets.

Barbitol Intoxication and Organic Degenerations—In the fatal case reported by Ravn, both liver and kidney degeneration were confirmed in the first twenty-four hours. The pancreas is thought possibly also to have been affected. He says that since liver insufficiency may occur in barbitol intoxication, the use of dextrose in treatment is rational.

- *Eosinophilia After Intravenous Oil Injection J. Engelbreth Holm—p. 29
- *Solitary Cecal Diverticula H. Thomsen—p. 45

Eosinophilia After Intravenous Oil Injection—Engelbreth-Holm's experiments in animals show that chaulmoogra oil does not have a positive eosinotoxic effect. Like any other oil it can, on intravenous injection, cause infarct formation in the lungs. Intravenous injection of oil irrespective of the kind of oil, will cause eosinophilia in the blood of rabbits. Since lung infarcts are the only pathologic process established in the animals with eosinophilia and since they are confirmed in all the animals with eosinophilia, the two changes are apparently related. In man a relation is seen between the blood eosinophilia observed after intravenous injection of chaulmoogra oil and the pulmonary changes analogous to those noted in animal experimentation. These changes or infarcts are not a specific chaulmoogra oil effect but are due to the fact that the substance is an oil.

Solitary Cecal Diverticula—Thomsen says that these diverticula are extremely rare and cites the eight cases found by him in the literature and presents three additional cases. The ages of the patients varied from 20 to 60. Solitary cecal diverticula (i. e., the cecal diverticula seen in patients not previously appendectomized) appear singly or at the most as two or three small pouches from the size of a pea to that of a walnut on the anterior wall of the cecum. The symptoms are identical with those of acute appendicitis, and the diagnosis in all the reported cases has been acute appendicitis. The danger of perforation seems to be greater in cecal diverticula than in appendicitis. Treatment has consisted in resection of the diverticulum itself or of the cecum. All the patients have recovered without any especial complications. Only one had perforation and peritonitis (Moschowitz).

CORRECTION

Use of Iron in Treatment of Pernicious Anemia—In the abstract of Mogensen's article in THE JOURNAL, February 16, page 604 in the third line from the bottom, the words 'blood platelet production' should be replaced by 'red blood cell production'.

HOSPITAL DISTRIBUTION AND HOSPITAL SERVICE

In this issue of *THE JOURNAL* appear the usual list of hospitals registered by the American Medical Association and the data relative to bed capacity, the average number of patients and the patients admitted. At the same time there is made available a survey of the occupancy of various types of hospitals during the last year. The reports are based on a study of 6,334 hospitals with an average daily census of 830,098 patients. The figures indicate that one person in seventeen made use of a hospital during the year. The average length of stay per patient in general hospitals was fourteen days. The other data that are available indicate that hospitals have also improved in the provision of laboratory, x-ray and physical therapy services.

The number of hospitals now in the United States has decreased by 103 over the number reported one year ago. This loss is explained by the development of certain mergers, and the closing of hospital departments of certain custodial institutions. Especially significant in the statistics now made available are the data relative to the length of stay of patients in hospitals. The length of stay of patients in governmental and nonproprietary institutions is considerably beyond that in independent, proprietary and corporation hospitals.

While the figures show that the number of idle beds in 1934 reached a record total of some 218,000, the patient days in all hospitals were almost 303,000,000, a gain of more than 7,000,000 over the previous year.

Almost coincidental with the publication of these data by the hospital department of the American Medical Association there has appeared a consideration of the need for more hospitals in rural areas published under the auspices of the *Modern Hospital*.¹ The statement indicates that this study, made by Alden B. and Patsy Mills, involved spotting local and community hospitals in various parts of the country on maps and then analyzing the maps in relationship to statistics of

population and measurements of distance. The results of the study indicate the fallacies that invariably arise in this type of survey. The authors conclude that 1,300 of the 3,075 counties of the United States containing 18,000,000 persons have no hospitals within their borders. They come to the conclusion that there are a considerable number of rural areas now without hospitals which ought to have them. The authors recognize that certain counties are often too small a unit to contain a satisfactory hospital and that frequently some counties do not have hospitals because good ones exist in cities just over the border in a neighboring county. Nevertheless an analysis made by the hospital department of the American Medical Association indicates the generally fallacious character of their observations. As shown in the accompanying table, 2,003 rural hospitals in the United States during 1934 had 50.2 per cent of their beds occupied. Moreover, 2,031 urban hospitals had 62.4 per cent of their beds occupied. While an occasional area might at this time actually require a hospital and be able to support one, the percentage of unoccupancy would indicate the hazard as either a commercial, scientific or philanthropic venture of attempting to establish new hospitals in a period of economic stringency such as now exists.

General Hospitals in Rural Areas Compared with Those in Urban Districts*

	Rural Places under 10,000 population			Urban 10,000 and over			
	No of Hos pitals	Beds	Base nets	Average Patients	Patients Admitted	Per Cent of Occu pancy	Length of Stay
Rural	2,003	68,500	10,710	34,629	1,073,603	50.2	12 da
Urban	2,031	282,023	37,921	176,069	5,022,426	62.4	13 da

* Including all registered general hospitals except army, navy, marine and veterans.

Using the method developed by Mr. Mills and his associates for studying hospital distribution as applied to the state of Alabama, one finds a need in that state for 1,905 more hospital beds. In developing their data they included three Florida counties and two Mississippi counties in Alabama and assigned two Alabama counties to Mississippi. A restudy of the situation reveals, however, that those areas to which they allocate the 1,905 additional beds already have sixty general hospitals whose combined capacity is 3,842 beds, of which only 1,778 were occupied. This means an average of 2,064 idle beds in a territory assumed to require 1,905 additional beds. The detailed statistical data concerning this situation are available for those who are interested.

Above all, these comparative studies indicate the danger inherent in attempting to analyze local situations in states far removed on the basis of data found in card indexes in an office in Chicago. In another issue of the *Modern Hospital* appears a series of comments² by Michael M. Davis, Kendall Emerson, Samuel A.

1 Mills, A. B. and Mills, Patsy. The Need for More Hospitals in Rural Areas. *Modern Hospital* 44: 50 (March) 1935.

2 Davis, M. M. Proper Use of Government Funds for Hospital Care—A Symposium, *Modern Hospital* 43: 80 (July) 1934.

Goldsmith, Fred K. Hoehler and Harry L. Lurie supporting the campaign of this journal for the building of more hospitals, again without any adequate recognition of the exact situation in the areas concerned. Thus the propaganda continues, based on preconceived notions rather than on exact and complete knowledge of the situation.

The conclusion is reached editorially in the *Modern Hospital* that government money available for public works should be assigned to the building of hospitals in some 500 or 600 rural sections which are presumed to need them, yet adequate data are not provided to indicate that these areas could actually support a hospital once the government had built it for them or that such a hospital could be adequately staffed from the medical profession available in the vicinity. Presumably Mr. Mills would have these 500 or 600 additional government hospitals staffed by physicians who would also be paid out of public funds.

The data concerning hospitals in this issue of *THE JOURNAL* are the most complete, accurate and up to date that have ever been assembled in any publication in this country. They represent a distinguished service of the Council on Medical Education and Hospitals to the medical profession and to the public. The maps should be studied with a comprehension of their geographic factors, the distribution of the population within the states concerned, the distribution of physicians, the per capita wealth of the community, the nature of its industry, and all the other data that are necessary to form a worthwhile opinion as to hospital services that are available and expansions that are possible.

THE CHEMISTRY OF THE HORMONES

Although the question of the chemical nature of the hormones has been a subject of interest for nearly two decades, progress in this field has been exceedingly difficult because of the lack of endocrine preparations of sufficient purity for accurate chemical studies. Recent extensive investigation, however, has led to vastly improved methods of preparation and ultimately to the isolation in pure crystalline form of a number of the hormones. Thus these heretofore inaccessible substances have been brought within the scope of attack by the chemist. Indeed, at present several hormones have been prepared in crystalline form and the chemical structure and method of synthesis of two of these have been definitely established. Also a number of other hormones have been prepared in a highly purified although noncrystalline state, and some information regarding their chemical properties has been obtained.

The first hormone to be isolated in crystalline form was epinephrine (1901). The determination of its chemical structure and synthesis followed within a few years. The structural similarity of epinephrine and tyramine, the decarboxylation product of the amino

acid tyrosine, suggests the possibility that this compound may serve as a metabolic precursor of the hormone. Epinephrine is optically active, the naturally occurring levo form possessing far greater physiologic activity than its optical antipode. The isolation in 1914 of a second crystalline hormone, thyroxine, was followed at length by the elucidation of its chemical structure and by its synthesis (1926). The striking chemical characteristics of thyroxine are the presence of iodine in the molecule and the similarity of a portion of its structure to tyrosine. As in the case of epinephrine, thyroxine is optically active and the naturally occurring levo form is far more active than the dextro isomer. Subsequent to the isolation in crystalline form of an estrogenic hormone from the urine of pregnant women (theelin) in 1929 and the testis hormone from male urine in 1932, these substances have been the subject of intensive chemical studies. Their properties early aroused the belief that they were closely related to the sterols, indeed, they appeared to be derivatives of cholesterol. The most recent studies have supported this hypothesis.¹ At the present time the fact has been fairly well established that theelin is ketohydroxy-estrin,² a derivative of phenanthrene, while the testis hormone differs from it only in the presence of a methyl group on the phenanthrene nucleus. The hydrated form of theelin, "theelol," is a trihydroxy-estrin which differs from theelin in its estrogenic potency.

Of the other known hormones, insulin has been prepared in a high state of purity. Apparently, insulin is an extremely large, complex, protein-like molecule and contains a number of the common amino acids. This conception is strengthened by the fact that crystals of the amino acids tyrosine, cystine, arginine, proline, phenylalanine and histidine have been obtained from hydrolyzed insulin. Pure insulin has not yet been isolated in crystalline form, however, the crystalline compounds obtained have been found to consist of salts of zinc or cadmium. A notable advance has been made in the isolation of progesterin, the progestational hormone of the corpus luteum, crystalline fractions have been obtained but these require more study. A number of other hormones, such as those of the anterior and posterior lobes of the hypophysis, parathyroid, gastrointestinal tract and thymus, have been prepared as physiologically active but chemically crude products. Particularly is this true in the case of the hormones of the anterior³ and posterior⁴ lobes of the hypophysis.

Thus, as was pointed out in the introduction⁵ to the articles on endocrinology now appearing in *THE JOUR-*

1 Du Vigneaud, V. The Chemistry of the Hormones from a Structural Standpoint. *Scient. Monthly* **40** 138 (Feb.) 1935.

2 Dodds, E. C. The Hormones and Their Chemical Relations. *Lancet* **1** 931 (May 5) 987 (May 12), 1048 (May 19) 1934.

3 Evans, H. M. Clinical Manifestations of Dysfunction of the Anterior Pituitary. *J. A. M. A.* **104** 464 (Feb. 9) 1935. Smith, P. E. General Physiology of the Anterior Hypophysis. *ibid.* **104** 548 (Feb. 16) 1935.

4 Geiling, E. M. K. The Posterior Hypophysis. *J. A. M. A.* **104**: 738 (March 2) 1935.

5 Fishbein, Morris. Glandular Physiology and Therapy. Introduction. *J. A. M. A.* **104** 463 (Feb. 9) 1935.

NAL, while information regarding the chemistry of the hormones is far more elaborate today than a few years ago, "only a beginning has really been made in our knowledge of this exceedingly complex and fascinating field." In view of the current intensive work on the constitution of the hormones, it is safe to predict that the story of the chemistry of many more of these powerful regulators of physiologic processes will soon be revealed.

THE STRUCTURE OF THE CELL

The usefulness of microscopic sections in investigative and clinical work has long clouded the fact that such pictures of cell structures are obtained only after subjecting the tissue to various physical and chemical procedures in order to make them visible. The technical methods of fixation and staining yield beautiful colors and a variety of lines and shades which are interpreted widely as evidence of what exists in the living cell, healthy or diseased, but this confidence in the reality of observations made by the usual technical methods has been gradually disappearing. The change in attitude has been aided by the results that have been achieved through direct studies of living tissue made possible by dark field illumination, tissue culture, microdissection, micrometabolism, vital staining and other methods.

The defects of the ordinary stained microscopic section have become apparent also with the realization that morphology cannot be divorced from function and that function depends to a great extent on the chemical changes that constantly go on within and between cells. Many recent studies, for example, have shown that the cancer cell has characteristic properties referable not so much to its shape or form as to its chemical behavior, particularly in relation to the chemical behavior of normal cells. Attempts have been made for decades to study the actual chemical structure of cells, but the problem has been beset with many difficulties. In making cellular details visible, profound alterations in their physical and chemical state occur. Within the last few years, however, the Altmann freezing-drying method has been elaborated at the Hull Laboratory of Anatomy of the University of Chicago and has been found to yield preparations of undenatured material on which a number of cytologic problems have been investigated. These observations have been recently published in a series of papers by Bensely and Gersh¹ and by Bensely and Hoerr.²

First the Chicago investigators attacked the problem of the chemical nature of mitochondria, those struc-

tures in the cytoplasm to which important functions have been attributed. The mitochondria contain 43.6 per cent of fatty substances but no lecithin or cephalin. They contain two different proteins. The so-called Nissl substance of the nerve cell is not uniformly distributed through the cytoplasm. Their variations as seen in disease may be due in part at least to artefacts produced by the fixation methods. Still other experiments have led to new conceptions of the structure of the cell nucleus, indicating among other things the possibility of a synthesis of nucleoprotein in the nuclear juice. Such fundamental considerations as the actual chemical basis of the organization of the cell form the topic of additional observations. They lead to the elucidation of the great biochemical riddle of the difference between protoplasm and solutions of protein.

These results have profound significance. In inflammation and repair, in bacterial and metabolic disease and in cancer the mystery of cellular activity holds the ultimate key to our understanding of disease. Life itself in the last analysis depends on cell structure and behavior. Many tools have been used to pry open the secret of the cell, but tools are only the eye-pieces of the scientific worker. Industrious and intelligent as he is, the practical inferences from his work depend on how closely his vision reaches to reality. Technical methods are nowhere more important than in the domain of the microscopic world. The boundaries of vision extended by the microscope now await only such methods as will not distort the living cell but actually bring to light its chemical behavior. The investigations that are being carried on by Bensely and his co-workers are precisely in this direction.

Current Comment

GENERAL SCIENTIFIC MEETINGS AT ATLANTIC CITY

The General Scientific Meetings arranged for the Cleveland session were so successful that they have been developed still further for the meeting to take place in Atlantic City from June 10 to 14. The complete program of the General Scientific Meetings appears under Association News in this issue of THE JOURNAL (page 1177). It will be noted that these meetings occupy three half-day periods on the first and second days of the annual session. They cover a wide variety of topics of current interest, including particularly changes in the blood, questions of diagnosis, and advances in endocrinology and therapeutics. These three special meetings, in which physicians from all over the United States and Canada will participate, constitute a concentrated postgraduate course for the general practitioner who wishes in a brief period to bring himself abreast of current knowledge in many fields.

Association News

THE ATLANTIC CITY SESSION Program of the General Scientific Meetings

In the General Scientific Meetings, which are held on the first two days of the annual session, the following papers will be read

MONDAY, JUNE 10—2 P M

Empyema in Children JAMES M MASON, Birmingham, Ala
Treatment of Deficiency Conditions

C P RHODES, New York
The Relationship of Drug Therapy to Agranulocytosis
ROY R KRACHE, Emory University, Ga
Our Knowledge Concerning the So Called Lymphoblastomas
EDWARD B KRUMBHAR, Philadelphia
Growth, Normal and Abnormal

WILLIAM BOYD, Winnipeg, Manit

TUESDAY, JUNE 11—9 A M

Evidence in Favor of a More Active Puerperium A Study
of Five Hundred Cases H B ATLEE, Halifax, N S
Treatment of Diabetic Coma HENRY J JOHN, Cleveland
Pitfalls to be Avoided in Abdominal Diagnosis

JOHN M T FINNEY, Baltimore

Diet in Treatment of Disease
LOUIS H NEWBRIGHT, Ann Arbor, Mich
The Surgeon's Responsibility in Cases of Duodenal Ulcer
R. R GRAHAM, Toronto, Ont

TUESDAY, JUNE 11—2 P M

Recent Developments in the Field of Endocrinology
DAVID P BARR, St Louis

Scope of Thoracic Surgery
JOHN ALEXANDER, Ann Arbor, Mich

Bone Changes in Certain Medical Diseases
A H GORDON, Montreal

Uses and Abuses of Modern Gland Products in Gynecologic
Disorders EMIL NOVAK, Baltimore

Advances in Therapeutic Technique BERNARD FANTUS, Chicago

Golf Tournaments at Atlantic City, June 10

The American Medical Golfing Association will hold its twenty-first annual tournament at the Northfield Country Club in Atlantic City, Monday, June 10

Thirty-six holes of golf will be played in competition for the seventy trophies and prizes in the nine events. Trophies will be awarded for the Association Championship, thirty-six holes gross the Will Walter Trophy, the Association Handicap Championship, thirty-six holes net, the Detroit Trophy, the Championship Flight, First Gross, thirty-six holes, the St Louis Trophy, the Championship Flight, First Net thirty-six holes, the President's Trophy, the Eighteen Hole Championship, the Golden State Trophy, the Eighteen Hole Handicap Championship, the Ben Thomas Trophy, the Maturity Event, limited to Fellows over 60 years of age, the Minneapolis Trophy, the Oldguard Championship limited to competition of past presidents, the Wendell Phillips Trophy, and the Kickers Handicap, the Wisconsin Trophy. Other events and prizes will be announced at the first tee

Dr Charles Lukens of Toledo is president and Dr C H Henninger of Pittsburgh and Dr John B Morgan of Cleveland are vice presidents of the American Medical Golfing Association, which was organized in 1915 by Dr Will Walter, Dr Wendell Phillips and Dr Gene Lewis, and now totals 1,100 members representing every state in the union. The first president, Dr Wendell Phillips of New York, played in every tournament since 1915, until his death Nov 16, 1934

ATLANTIC CITY COMMITTEE

The Atlantic City Committee is under the chairmanship of Dr Walt P Conaway, 1723 Pacific Avenue, Atlantic City, assisted by Drs I R Beir, John Pennington, Alfred Westney and Rostin White

APPLICATION FOR MEMBERSHIP

All male Fellows of the American Medical Association are cordially invited to become members of the A M G A. Write the Executive Secretary Bill Burns, 4421 Woodward Avenue, Detroit, for an application blank. Participants in the A. M. G. A. tournament are required to furnish their home club handicap, signed by the secretary. No handicap over 25 is allowed, except in the Kickers' (Blind Bogey). Only active members of the A. M. G. A. may compete for prizes. No trophy is awarded a Fellow who is absent from the annual dinner

MEDICAL BROADCASTS Columbia Broadcasting System

The American Medical Association broadcasts on a western network of the Columbia Broadcasting System each Thursday afternoon on the Educational Forum from 4 30 to 4 45, central standard time. The next three broadcasts will be as follows

April 4 Negro Health Week W W Bauer M D
April 11 Sickness Insurance R G Leland M D
April 18 Catarrh, W W Bauer, M D

National Broadcasting Company

The American Medical Association broadcasts under the title "Your Health" on a Blue network of the National Broadcasting Company each Tuesday afternoon from 4 to 4 15, central standard time. The next three broadcasts will be as follows

April 2 Sickness Insurance or Your Own Private Physician R. G Leland M D
April 9 Crying for the Moon, W W Bauer M D
April 16 Meeting a Challenge W W Bauer, M D

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION, PUBLIC HEALTH, ETC.)

ARIZONA

Society News—The Pima County Medical Society was addressed in Tucson in February by Drs Frank Gregory Connell, Oshkosh, Wis, on "Surgical Treatment of Peptic Ulcer," and Samuel J Fogelson, Chicago, on "Mucin Treatment of Peptic Ulcer." Dr John Alexander, Ann Arbor, discussed thoracic surgery before the society at the March meeting

ARKANSAS

Bills Enacted—The following bills have become laws. S 267, requiring the homeopathic medical board, the eclectic medical board, the "State Medical Board of the Arkansas Medical Society," the board of osteopathic examiners, and the board of chiropractic examiners to file with the secretary of state a list of all persons who have been licensed within the past twenty years, and to file with the secretary of state similar lists with respect to all licenses to be issued in the future by them, within one week of the issuance of the licenses, H 218 amending the medical practice act so as to authorize the board of medical examiners in its discretion to license without examination diplomates of the National Board of Medical Examiners, and H 189, prohibiting the sale of barbituric acid derivatives and/or compounds thereof except on the prescription of a licensed physician

CALIFORNIA

Society News—The radiologic section of the Los Angeles County Medical Society presented the society with a speakers' stand recently. Speakers before the Los Angeles Surgical Society, March 8, were Drs Philip J Murphy on "Diagnosis and Surgical Judgment in the Acute Abdomen", Rafe C. Chaffin, Vesicovaginal Fistula with a New Technique for Post-operative Treatment", William H Daniel, "Surgical Management of Carcinoma of the Rectum", Edward J Kilfoy, "Paralytic Ileus Following Removal of Cataract."—The Los Angeles Society of Neurology and Psychiatry devoted its meeting, March 20, to a symposium on the postconcussion syndrome. Speakers were Drs Arthur R Timme, Cullen W Irish, Johannes M Nielsen, Carl W Rand, Cyril B Courville and

Samuel D. Ingham.—San Francisco reported an infant mortality rate of 33 per thousand in 1932, the lowest rate on record, an increase was noted in the birth rate, 104 per thousand—Dr. Frederick C. Warnshuis, San Francisco, addressed the San Francisco County Medical Society, March 12, on "The Medical Profession's Declaration of National Principles as Related to Medical Economics"

COLORADO

Narcotic Drug Law Enacted—Two bills, which were approved by Governor Johnson March 16 and which were to become effective immediately, are of considerable interest to physicians. One of them (H 557) prohibits the retail sale except on the written prescription of a licensed physician, dentist or veterinarian, of barbitol, sulphonethylmethane (trional), sulphonmethane (sulphonol), diethylsulphon diethylmethane (tetronal), paraldehyde, and chloral or chloral hydrate or any derivatives compounds or mixtures of any of these drugs possessing hypnotic properties or effects. The other (H 138) is the uniform narcotic drug act, drafted by the Conference of Commissioners on Uniform State Laws with the aid of the Bureau of Legal Medicine and Legislation of the American Medical Association, and approved by both the American Medical Association and the American Bar Association. The term "narcotic drug," as used in this law, includes coca leaves, opium, cannabis and every substance neither chemically nor physically distinguishable from them. A physician or a dentist, acting in good faith and in the course of his professional practice only, may prescribe, administer and dispense narcotic drugs or he may cause them to be administered by a nurse or intern under his direction and supervision. Physicians and dentists are to keep a record of such narcotic drugs received by them and a record of all such drugs administered, dispensed or professionally used by them otherwise than by prescription. Uniform narcotic drug acts have been enacted in about fifteen other states. Both laws will be published in full in a coming issue of *Colorado Medicine*.

GEORGIA

Bill Passed—H 230 has passed the house, proposing to amend those provisions of the medical practice act which require an applicant for a license to be a graduate of a legally incorporated medical college in good standing with the board by permitting graduates 'of one of the two colleges of medicine now existing in the state of Georgia' also to qualify.

Bills Introduced—H 918 proposes a new insurance code. Among other things, it proposes to permit any hospital or group of hospitals, not maintained by public funds, approved by the Georgia Hospital Association, the Georgia Medical Association, the American College of Surgeons or the American Medical Association, to form a nonprofit organization to provide hospitalization to the public, in consideration of weekly, monthly or annual dues. H 874, to supplement the chiroprody practice act, proposes (1) that the joint secretary of the examining boards of Georgia act as joint secretary of the state board of chiroprody examiners, (2) to provide that a member of the board may not be directly or indirectly associated or connected with any institution teaching chiroprody, (3) to require all institutions in the state teaching chiroprody to register the name of each student with the joint secretary not later than thirty days after the enrolment of that student and (4) to authorize the board to inspect and classify all institutions teaching chiroprody.

ILLINOIS

Society News—At a meeting of the Vermilion County Medical Society, March 6, Dr. Arthur H. Parmelee, Oak Park, spoke on 'Respiratory Diseases in Children'—Dr. Chauncey C. Maher, Chicago, addressed the Whiteside County Medical Society, February 28, in Sterling on hypertension—Dr. Harold O. Jones, Chicago, discussed 'Diagnosis and Treatment of Carcinoma of the Cervix and Uterine Endometrium' before the Peoria City Medical Society, March 5.

Bills Introduced—H 672 proposes to prohibit the retail sale or distribution of veronal, barbitol or any of their salts, derivatives or compounds except on the prescription of a licensed physician, dentist or veterinarian. H 559 to amend the optometry practice act, proposes among other things, (1) to require applicants for licenses to be citizens of the United States or to have received their first naturalization papers, (2) to prohibit corporations from practicing optometry and (3) to prohibit advertising that in any way will tend to deceive or defraud the public the free examination of eyes or of fixed prices for optometric services. H 634 proposes to require employers to install exhaust systems for removing dust and dirt from grinding, polishing and buffing operations.

CHICAGO

Anniversary of Maimonides—The eight hundredth anniversary of Maimonides was observed at a celebration at the Standard Club, March 24. The occasion was also an observance of the tenth anniversary of the opening of the Hebrew University in Jerusalem. Dr. Morris Fishbein, editor of *THE JOURNAL*, was chairman. Rabbi Solomon Goldman gave an address on Maimonides, and Drs. Nathan O. Ratnofsky, Marcus Rothschild and Israel Strauss, New York, spoke on the medical department of the Hebrew University.

Vitamin D Milk Standards Adopted—The Chicago Board of Health has recently adopted rules and regulations for the production and control of vitamin D milk. Three processes for this purpose have been accepted, including ultraviolet irradiation, the addition of an approved vitamin D concentrate in a satisfactory manner, and the feeding of concentrated vitamin D substances to dairy cows under suitable conditions. A series of regulation application forms and other data have been developed to guide those who wish to apply to the board for permits to distribute such milk in the Chicago area.

Banquet in Honor of Dr. Tice—About 1,400 persons attended a banquet in Chicago at the Palmer House, March 23, to honor the long services of Dr. Frederick Tice, clinical professor of medicine, Rush Medical College, to the Cook County Hospital and the Municipal Tuberculosis Sanatorium. Dr. Frank Jirka, state health commissioner, Springfield, was toastmaster. Addresses were made by many public officials and also Drs. William A. Pusey, Samuel R. Slaymaker, Allan J. Hruby and Morris Fishbein. Dr. Tice is also emeritus professor of medicine at the University of Illinois College of Medicine.

IOWA

Bill Passed—S 20 has passed the house, proposing that before any applicant for a license to practice medicine, osteopathy, osteopathy and surgery or chiropractic may be examined by his professional board he must first pass an examination before an impartial basic science board in anatomy, physiology, chemistry, pathology, bacteriology and hygiene.

Bills Introduced—S 220, to amend the chiropractic practice act, proposes (1) to define chiropractors as persons who treat human ailments by the adjustment by hand of the articulation [sic] of the spine or by other incidental adjustments calculated to remove any cause and/or effect of any nerve interference, who may use in connection therewith, physical, mechanical, hygienic and sanitary measures, and (2) to provide that a license to practice chiropractic shall not authorize the holder thereof to practice operative surgery, osteopathy, nor to administer or prescribe any drug or medicine included in materia medica. S 250 and H 383 propose to authorize the board of supervisors of any county to make contracts with licensed practitioners of the healing art for the care of the indigent sick of the county. S 256 and H 378 propose to prohibit public nurses from favoring any particular branch of the healing art or from discriminating against any practitioner. H 329 proposes to amend the law according to hospitals treating persons injured through the fault of others liens on all claims, judgments, settlements or compromises accruing to the injured persons by reason of their injuries, by according the lien also to physicians who have treated such persons. H 396 proposes to require insurance companies to recognize any required report or statement or notice relative to an insured person when furnished by any licensed practitioner of the healing art.

Society News—Speakers before a meeting of the Tri-County Medical Society (Henry, Washington, Jefferson) in Mount Pleasant, February 28, were Drs. Walter D. Abbott, Des Moines, "Peripheral Nerve Injuries", Arthur W. Erskine, Cedar Rapids, "Common Fractures of Wrist Joint," and Oliver J. Fay, Des Moines, "What of Your Economic and Professional Future?"—Dr. Frederick H. Falls, Chicago, discussed "The Early Diagnosis and Treatment of Carcinoma of the Uterus" before the Black Hawk County Medical Society, February 19.—Dr. Lee W. Dean, St. Louis, will speak before the Linn County Medical Society, April 11, in Cedar Rapids his subject will be "The Diagnosis and Treatment of Nasal Sinus Disease in Infants and Young Children."—At a meeting of the Cass and Audubon county medical societies in Atlantic, February 27, speakers included Dr. Matthew E. O'Keefe, Council Bluffs, on "Intestinal Obstruction Secondary to Acute Infections"—Dr. Joseph L. Stech, Council Bluffs, among others, addressed the Clarke County Medical Society in Osceola, February 5, on "Management of Head Injuries"—Speakers before the Fremont County Medical Society in Hamburg, February 13, included Dr. Donald J. Wilson, Omaha, on "Common Lesions About the Mouth and Mucous Membranes"—The Hardin

County Medical Society was addressed in Eldora, February 26 by Dr Herbert W. Rathe, Waverly, on "Modern Treatment of Lobar Pneumonia"

MARYLAND

Study of Maternal Mortality—The Baltimore City Medical Society adopted a resolution, February 15 requesting the city health department to undertake a survey of causes of maternal mortality. The resolution urges members of the society to support the health department in developing its new division of maternity hygiene. This division replaces the home obstetric service, which was abandoned by the department, March 1.

Spinal Meningitis—Fourteen cases of spinal meningitis with six deaths were reported to the Baltimore Health Department between January 1 and February 12, according to *Baltimore Health News*. Two of the deaths were of nonresidents brought to Baltimore for hospitalization. One of the cases occurred in a transient bureau dormitory in the city, while two others were in transients quartered at an army camp within the city limits.

MASSACHUSETTS

Grant to Publish Research Material—The Massachusetts Department of Mental Diseases announces the acceptance of a grant of \$26,000 from the Rockefeller Foundation to finance publication of research material embracing a study since 1928 of many thousands of cases of mental illness throughout the state. At least four volumes will be published under the grant, which will cover a period of five years. According to the report, the first volume will be based on a study of 120,000 cases, the second, 20,000, the third 11,000 and the fourth, 4,000. The material has been compiled under the supervision of Dr Neil A. Dayton, Boston, director of statistics and research for the department. Dr Winifred Overholser, Boston, is commissioner of mental diseases.

Discontinue Publicizing Clinics—In accordance with a recent decision of the state department of health, local cancer committees have been asked to discontinue publicity urging patients to attend clinics. Instead, patients will be asked to consult their private practitioners, who in turn will refer them to the clinics. The revision of the program was said to have been caused by the protests of private practitioners who said they had lost practice through the increasing number of persons attending cancer clinics. There are fifteen of these clinics in Massachusetts, it was stated, all of which are governed by a program of the state department of health, which has been in force for several years. Under the new plan it is expected that the cancer clinics will become highly specialized consultation services where patients will be sent by private practitioners who have definitely diagnosed a cancerous or precancerous condition.

MICHIGAN

Dr Ekelund Named Secretary of State Society—Dr Clifford T. Ekelund Pontiac, has been selected as the secretary of the Michigan State Medical Society, succeeding Dr Frederick C. Warnshus, who resigned to accept a similar position with the California Medical Association. Dr Ekelund, who is 41 years of age graduated from the University of Minnesota Medical School, Minneapolis, in 1918. He is now president of the Oakland County Medical Society.

MINNESOTA

Dr Vogt Warned to Stop Practice—The Minnesota State Board of Medical Examiners issued a warning, February 22, to Dr Frederick C. Vogt, Chicago, to stop practicing medicine without a license in Minnesota. Dr Vogt is licensed to practice in Illinois but has no license in Minnesota. According to the board, he was conducting a so called graduate class in hernia at the Curtis Hotel in Minneapolis and charging a tuition fee of ten dollars. About forty physicians were in attendance from Minnesota, North Dakota and Wisconsin. At first Dr Vogt stated that he was called in consultation, but when this was refuted he said he was merely giving lectures. However, he finally admitted that persons had been treated for hernia by injections. Dr Vogt was born in 1881 and holds a diploma from the St. Louis University School of Medicine 1906. He is not a member of the American Medical Association. He was formerly associated with an advertising varicose vein treatment concern known as the Viscose Ambulatorium. In 1931 he was associated with the Illinois Intravenous Institute and with the Vortex Company in a varicose vein treatment. He is now connected with the Loop Health Center, 159 North State Street, Chicago, the board reports. He told the Minnesota board that he would leave the state at once.

NEVADA

Bills Introduced—A 261 proposes that all applicants for licenses to practice medicine, surgery, osteopathy, chiropractic, naturopathy or any other system or method of healing, as a condition precedent to examination by their respective professional boards, pass examinations in human anatomy, human physiology, human pathology, chemistry and hygiene, to be given by an impartial board of examiners. The governor is to appoint such examiners as are necessary to conduct the examinations but no examiner is to be actually engaged in the practice of any method or system of healing. S 142, to amend the medical practice act, proposes (1) to make "disobedience," rather than "wilful disobedience," of the law or of the rules and regulations of the state board of health a ground for revoking a license to practice medicine, (2) in addition to authorizing the board to revoke licenses for cause, to permit the board to suspend licenses for a period not exceeding one year or "to take such other action in relation to the punishment of the holder of said certificate as in its discretion it may deem proper," and (3) to require a person whose license has been revoked or suspended, to petition within thirty days (rather than sixty days) after the board has certified to the appropriate county recorder that it has revoked or suspended the license, the appropriate district court to review that action. A 260 proposes to create a board to arrange for and to supply necessary maintenance, medical and surgical treatment, and hospitalization to indigent expectant mothers.

NEW JERSEY

Millions for Medical Institutions—By the will of the late Walter G. Ladd, the following bequests will become effective after the death of his widow. Somerset Hospital, Somerville, N. J., \$100,000, Elizabeth General Hospital and Dispensary, Elizabeth, N. J., \$25,000. The remainder of the estate about \$10,000,000, is to be divided into three trust funds: one to maintain his family estate in New Jersey as a convalescent home for "deserving gentlewomen," one to aid such persons elsewhere and the third to be used for hospitals, medical schools, universities, colleges and similar institutions "not existing for pecuniary profit." At the end of fifty years, the trusts are to be terminated and the principal to be divided among several institutions, including New York Post-Graduate Medical School and Hospital, New York, and Johns Hopkins Hospital, Baltimore.

NEW YORK

Bill Passed—A 461 has passed the assembly, proposing to amend the medical practice act by making it unlawful for any one other than a licensed physician to conduct, direct, supervise or control the work or reports of a clinical laboratory which is defined as "a laboratory in which tests are made on individual persons, their secretions, excretions, blood and tissues, to aid in the diagnosis, prognosis, or treatment of the individual's physical or mental state or states."

Dr Smiley Joins State Education Department—Dr Dean Franklin Smiley, for fifteen years director of the student health service at Cornell University, Ithaca, has been appointed director of the divisions of health and physical education in the state education department at Albany. The position, vacant for several years, was at one time occupied by Frederick Rand Rogers, Ph.D., now at Boston University. Dr Smiley, who was also assistant professor of hygiene at Cornell, was president of the American Student Health Association in 1932. In 1927 he made a study of the effect of athletic training on student health and the hygiene of undergraduate athletics as part of a study made by the Carnegie Foundation for the Advancement of Teaching.

Bills Introduced—S 1667, to amend the medical practice act, proposes to authorize the revocation of the license of a physician who "has been guilty in any way of unprofessional conduct." S 1714 proposes that the commissioner of education prescribe rules and regulations for the establishment and regulation of schools of natural therapy and to license graduates of such schools to practice natural therapy. The course of instruction in such a school is to include a "complete analytical and comprehensive study of the following subjects: 1 Hydrotherapy 2 Balneology 3 Cibology 4 Dietology 5 Hirudology 6 Hygiene 7 Clysmology 8 Lavatology 9 Massage 10 Phlebotomy 11 Potiology 12 Rotology 13 Electrolysis 14 Scalp treatment 15 Physiotherapy." A 2207 proposes to forbid the operation of any x-ray machine or apparatus in connection with laboratory or hospital work, unless such x-ray machine or apparatus is equipped with a shock absorbing device of a design approved by the commissioner of health.

New York City

Personal—Dr Leona Baumgartner has been awarded the prize of the New England Pediatric Society for the best paper presented last year by fourth year medical students in New England on a subject of scientific interest in connection with the health of children. Dr Baumgartner's subject was "Age and Antibody Production." She graduated in June 1934 from Yale University School of Medicine, New Haven.

Society News—A symposium on angina pectoris with special reference to coronary artery disease was presented at the stated meeting of the New York Academy of Medicine, March 7, by Drs Harold M. Marvin, New Haven, Conn., Emanuel Libman and Harlow Brooks—Dr Alfred W. Adson, Rochester, Minn., among others, addressed a joint meeting of the New York Neurological Society and the section of neurology and psychiatry of the New York Academy of Medicine, March 5, on "Malignant Hypertension: Results Obtained by Sympathectomies and Rhizotomies."—The Medical Society of the County of New York held an open forum, March 28, for the discussion of "The Future of Medicine." Speakers were Drs Morris Rosenthal, Frederic E. Sondern, Haven Emerson and Samuel J. Kopetzky—Dr Frederic E. Sondern addressed the Bronx County Medical Society, February 20, on national health insurance in England—Dr Ralph Colp addressed the New York Surgical Society, February 27, on "The Relation of Cholecystitis to Pathologic Changes in the Liver."—Speakers at a meeting of the Kings County Medical Society, February 19, were Drs John A. Kolmer, Philadelphia, on "Immunity and Vaccination Against Acute Anterior Poliomyelitis," and LeGrand Kerr, Pediatrics in the Gay Nineties—Dr John C. MacLitt, on behalf of alumni of St. Mary's Hospital presented to the society a portrait of Dr John Byrne, who became a member of the society in 1858. Dr Byrne was president of the New York Obstetrical Society in 1874 of the Brooklyn Gynecological Society, 1890, and of the American Gynecological Society, 1892. He was one of the founders of the Long Island College Hospital.

NORTH CAROLINA

Bill Enacted—H 148 has become a law granting to physicians and hospitals treating persons injured through the negligence of others liens on all sums recovered as damages by the injured persons by reason of their injuries.

Bill Passed—H 539 has passed the house, proposing to repeal the law requiring a male applicant for a marriage license either to sign an affidavit that he is free from venereal disease and active tuberculosis or to present a certificate from a licensed physician to that effect.

OHIO

Officers of State Board—Dr James G. Blower, Akron, was elected president of the Ohio State Medical Board at a recent meeting. Other officers elected are Drs John R. Shoemaker, Cuyahoga Falls, vice president, Louis T. Franklin, Chillicothe, treasurer, and Herbert M. Platter, Columbus, secretary.

Appointments at University of Cincinnati—Dr David A. Tucker Jr., associate clinical professor of contagious diseases at the University of Cincinnati College of Medicine, was appointed professor of the history of medicine at the February meeting of the board of directors. Dr George M. Guest was promoted to associate professor of pediatrics, among other changes. Dr Robert D. Maddox was appointed lecturer in military medicine and is giving a new course in that subject this semester.

Bills Introduced—H 307, to amend the sales tax law, proposes that a sales tax shall not be levied on the sale of medicine on a prescription issued by a licensed physician, when filled by a registered pharmacist—H 497 proposes to establish, in the state department of health a bureau of social hygiene to reduce illegitimacy and to improve health and family conditions by the control of venereal diseases. The bureau is to be authorized to establish local clinics for the administration of free treatments for venereal diseases.

Fifty Years in Practice—Dr Florus F. Lawrence, Columbus, was the guest of honor at a dinner given by his colleagues, March 7, in celebration of his completion of fifty years of medical practice—Dr Wilson H. Button, Hubbard, recently celebrated the fiftieth anniversary of his graduation from Western Reserve University School of Medicine, Cleveland. Dr Button has practiced in Hubbard since 1896—Dr James B. Hannah Addyston, marked the completion of fifty years of medical practice, March 5. Dr Hannah was graduated from the Medical College of Ohio, Cincinnati, in 1885.

OKLAHOMA

Bills Introduced—H 80, to amend the workmen's compensation act, proposes, among other things, to permit an injured employee to select at the employer's expense his own physician to treat his industrial injuries. H 207 proposes to exempt from the provisions of the insurance laws of the state all hospital associations engaged in the business of "indemnifying policy or certificate holders in said associations against the cost of medical surgical and hospital services and accommodations." H 425 proposes to prohibit the sale or other distribution, except by a licentiate of the state board of pharmacy, of appliances, drugs or medicinal preparations intended or having special utility for the prevention of conception and/or of venereal diseases.

Society News—Drs Edward H. Skinner, Kansas City, Mo., and Wendell M. Long, Oklahoma City, discussed cancer and conducted clinics at a meeting of the Garfield County Medical Society, Enid, February 19—Among speakers at a meeting of the Southern Oklahoma Medical Association, Ada, March 5, were Drs George L. Carlisle and Arthur J. Schwenkenberg, Dallas, Texas, on cardiac neurosis, James B. Eskridge Jr., Oklahoma City, female sex hormones, and Henry H. Turner, Oklahoma City, endocrine glands—Physicians of Cherokee, Haskell, McIntosh, Muskogee, Okfuskee, Okmulgee, Tulsa and Wagoner counties participated in a joint meeting of the Muskogee, Tulsa and Okmulgee county medical societies in Muskogee, March 28. Speakers were Drs Isaac W. Bollinger, Henryetta, on silicosis, Walter S. Larrabee, Tulsa, disorders of the back, and Ira B. Oldham Jr., Muskogee, skeletal fixation in fractures—At a meeting of the Carter County Medical Society, Ardmore, February 25, speakers were three Dallas physicians: Drs Ben R. Buford, on pellagra, Walter G. Reddick, differential diagnosis of conditions causing edema, and Dayton C. McBride, obesity—Drs Jefferson R. Lemmon, Amarillo, Texas, and Herbert L. Wright, Supply, among others addressed the Woodward County Medical Society, February 12, on "Pneumonia in Children" and "Purposes of the Allied Sciences," respectively.

OREGON

Endowment for Children's Hospital—The First Hebrew Benevolent Association of Portland recently gave to the Doernbecher Memorial Hospital for Children at the University of Oregon Medical School a fund of \$5,000 for maintenance of a bed in memory of the late Marx Cohen. The fund was left by Mr. Cohen to the association as a trust fund to be utilized for medical and surgical treatment of children under 16 who through poor financial circumstances would be unable to obtain such treatment.

PENNSYLVANIA

Hospital News—The secretary of the staff of the Center County Hospital, Bellefonte, has notified THE JOURNAL that Dr Enoch H. Adams, Berwick, has not been made surgeon in chief to the Center County Hospital, as was reported February 16.

Bills Introduced—H 1521 proposes that all hospitals receiving state appropriations have in attendance at all times at least one licensed physician or resident intern who shall have graduated from an approved medical college. H 1604, to supplement the workmen's compensation act, proposes to make the following occupational diseases compensable: chrome ulceration, epitheliomatous cancer, ulceration of the skin or the corneal surface of the eye, chronic miners' asthma, silicosis, anthrax, infection or inflammation of the skin due to contact with oils, cutting compounds or lubricants, dusts, liquids, fumes, gases or vapors, and poisoning from lead, mercury, phosphorus, arsenic, methanol, carbon bisulphide, naphtha or volatile halogenate hydrocarbons, manganese dioxide, brass, zinc, benzol, nitro and amido derivatives of benzol, and radium.

Philadelphia

New Professorships—Three new clinical professorships have been established at the University of Pennsylvania School of Medicine and have been filled by the advancement of Drs Thomas Grier Miller, Richard A. Kern and Charles C. Wolferth from the rank of assistant professor. Dr Truman G. Schnabel, assistant professor of medicine, has been advanced to an associate professorship.

Personal—A portrait of Dr Martha Tracy, dean of the Woman's Medical College of Pennsylvania, was presented to the college on its eighty-fifth anniversary, March 9. This is Dr Tracy's twenty-fifth year at the college. Dr Ellen C. Potter, Trenton, N. J., made the presentation. Dr Helen Ingleby, professor of pathology on behalf of trustees faculty,

students and friends, presented in automobile to Dr Tracy. The obstetric staff of Jefferson Medical College gave a dinner in honor of Dr P Brooke Blund, recently, in honor of his completion of ten years as professor of obstetrics at the college. Speakers were Drs Jacob Parsons Schieffer, Henry K Mohler, Charles E G Shrimmon and Edward L Bauer. The first Edwin A Jurecki Memorial Lecture at the Jewish Hospital was given, February 4 by Dr Samuel A Levine, Boston on "The Relation of the Thyroid Gland to Heart Disease." Dr Jurecki who died Sept 9, 1934, was chief resident physician at the hospital.

VIRGINIA

Course in Pediatrics—Dr Samuel F Ravenel Greensboro N C, is giving a graduate course in pediatrics in South Boston under the auspices of the department of clinical and medical education of the Medical Society of Virginia. Meetings began, March 5, to be held twice each week for five weeks.

The McGuire Lectures—The Stuart McGuire Lectures at the Medical College of Virginia, Richmond, will be given April 29-30, by Dr Gunnar Nystrom professor of surgery, University of Upsala, Sweden. His subjects will be Embolism of the Arteries of the Extremities and Pulmonary Embolism. During the day of April 30, the college will hold its spring graduate clinics.

New Health Units—The state health department has recently established new units in several sections of Virginia by the aid of \$66,000 allocated to the state by the U S Public Health Service. The following health officers have been appointed:

Dr Chaslis H Dawson, Suffolk, the district including James City, York, Warwick and Elizabeth City counties.
Dr William F Wild Bridgeport Conn. to succeed Dr Dawson at Suffolk and the district including Nansemond and Isle of Wight counties.
Dr David H Andrew formerly of Parkton Md Wythe County, with headquarters at Wytheville.
Dr Daniel C Steelmuth formerly state health officer of Iowa the district made up of Halifax and Pittsylvania counties at South Boston.

RHODE ISLAND

Bills Introduced—H 708 proposes to require all applicants for licenses to practice any of the healing arts, as a condition precedent to examination by their respective professional boards, to pass examinations in anatomy, physiology, pathology, diagnosis, chemistry, bacteriology and public health to be given by a board of examiners in the basic sciences. The board is to be composed of three members appointed by the director of public health, all of whom shall be selected for their proficiency in the basic sciences, and none of whom may be a member of any of the various professional examining boards. H 712 to amend the osteopathic practice act, proposes that "a certificate to practice osteopathy shall confer upon the holder thereof the same rights and privileges and the same duties and obligations as a certificate to practice medicine, except the practice of major surgery." H 736 proposes to limit the retail sale or distribution of contraceptive devices, prophylactic rubber goods and other articles, drugs or medicinal preparations primarily manufactured, produced or intended to be used as contraceptives or for the prevention of venereal diseases, to licensed physicians and pharmacists.

SOUTH CAROLINA

Bills Introduced—H 583 to amend the optometry practice act, proposes that "an optician as licensed under this act shall be deemed to be any person who fills the order or prescription of a licensed optometrist or legally qualified physician and surgeon for lenses, spectacles or eyeglasses or parts thereof, or who surface grinds lenses, or edges, drills, mounts, assembles or adjusts spectacles, or eyeglasses, or parts thereof, to given measurements." Nothing in the law is to be construed to permit licensed opticians to do more than is covered by the foregoing definition. The bill also proposes to prohibit the practice of optometry by corporations and to define optometry as "the science and art which treats of the measurement of the functions and powers of vision and the anomalies thereof, and their emendation by physical means." H 246 proposes to compensate workmen for injuries arising out of and in the course of their employment. The employer must furnish and pay for such medical surgical, hospital and other treatment as may be reasonably required to relieve the injured workman from the effects of his industrial injury, for a period of not exceeding ten weeks from the date of the injury and for such additional time as in the judgment of the South Carolina Industrial Commission will tend to lessen the period of compensation.

WEST VIRGINIA

Bills Enacted—The following bills have become laws. H 160 amending the workmen's compensation act by (1) requiring the compensation commissioner to pay such sums for medical, surgical and hospital treatment as may reasonably be required to relieve an injured employee, the prior law limiting such payments to \$800, and (2) eliminating those portions of the prior law which prohibited the commissioner from paying for medical and hospital services furnished an injured workman, if the workman was entitled under a contract connected with his employment or by reason of a subscription list, to receive medical, surgical and hospital treatment without further charge to him, and S 155, supplementing the insurance laws, by permitting stock companies to incorporate under the general incorporation laws of the state. Companies so incorporated are to be permitted to issue policies providing "every coverage appertaining to accident and health insurance." Specifically they may issue policies providing "reimbursement for expenses incident to personal injury, sickness or death," but they may issue also policies of accident and health insurance covering personal injury, disablement or death by accident, disability resulting from sickness." The provisions of this law may be construed to authorize a corporation organized under it to furnish directly to its policyholders medical nursing, laboratory and hospital services.

WISCONSIN

Bills Introduced—A 488 proposes that no person not a graduate of a class A medical school, as classified by the American Medical Association, shall be on the medical staff of state hospitals and institutions. A 507 proposes to amend the law requiring a male applicant for a license to marry to present a physician's certificate showing freedom from venereal diseases by requiring such certificates from both parties to a proposed marriage.

GENERAL

Society News—The Pan-American Medical Association has chartered the S S Columbia for its second "floating congress, July 18-August 28, for which the following itinerary has been announced: New York, Havana, Curaçao, five days at Rio de Janeiro for a scientific congress, three days at Santos for a meeting in São Paulo, returning via Trinidad, Santo Domingo, Kingston, Havana and New York. These plans were announced at a dinner in honor of Oswaldo Aranha, Brazilian ambassador to the United States, given by the New York chapter of the association at the Hotel Ritz Tower, March 1. Dr Joseph Jordan Eller, 745 Fifth Avenue, New York, is director general of the association. The Population Association of America will sponsor a conference on population studies in relation to social planning at the Hotel Willard, Washington, D C, May 2-4. Henry Pratt Fairchild, New York, is president of the association and Frank Lorimer, 308 Victor Building, Washington, D C, secretary. Dr Stephen S Brown, director of the Maine General Hospital, Portland, was elected president of the New England Hospital Association at its annual meeting, February 7-9. Dr Albert G Engelbach, Massachusetts General Hospital Boston, was reelected secretary. The sixty-fourth annual meeting of the American Public Health Association will be held in Milwaukee, October 7-10.

Medical Bills in Congress—Changes in Status S 5 proposing to prevent the manufacture, shipment and sale of adulterated or misbranded food, drink, drugs and cosmetics, and to prevent the false advertisement of such articles, has been favorably reported to the Senate, with amendments (S Rept. 361). S 1850 has passed the Senate, proposing to amend an act entitled "An Act to recognize the high public service rendered by Major Walter Reed and those associated with him in the discovery of the cause and means of transmission of yellow fever," by including Roger P Ames among those honored by the act. **Bills Introduced** S 2314, introduced by Senator Shipstead, Minnesota, proposes to extend the benefits of the Emergency Officers' Retirement Act to certain emergency officers of the War with Spain, the Philippine Insurrection, and the Chinese Boxer Rebellion. H R 6873, introduced by Representative Rabaut, Michigan, proposes to erect a veterans hospital in or near the city of Detroit. H R 6906, introduced by Representative Mead, New York, proposes to revise and amend the federal food and drugs act to prevent the manufacture, shipment and sale of adulterated or misbranded food, drugs and cosmetics, and to prevent the false advertising of such articles. H R 6907, introduced by Representative Hoepfel, California, proposes to extend the benefits of existing veterans' laws and regulations to officers and enlisted men of the Army, Navy, Marine Corps and Coast Guard who suffer injury, disease or death while on authorized leave of absence or furlough.

Whither National Health Insurance?

In previous letters it has been shown that the further socialization of medicine is a primary object of the labor party and that the future of health insurance depends on whether that party again attains power, a danger that is generally admitted. In 1930, when this party was in power, the British Medical Association brought forward a scheme for a state medical service for the whole population. This great plunge into further medical socialism was not proposed because of any desire for it on the part of the profession or of the association but to forestall a possible scheme of the labor government. Soon afterward the prodigal finance of that government brought the country to the brink of ruin. There was a first class financial crisis and the pound crashed. The crushing defeat of the labor party followed and removed the danger—for a time—and no more has been heard of the association's scheme. At the recent annual conference of the labor party the national executive committee of the party submitted a report stating that there are grave defects in the panel system as regard both the type and the standard of medical care. The committee proposes that medical benefit should be taken away from health insurance altogether and that the insured should receive only cash benefit. It would enlarge the insurance scheme by including nonmanual workers with incomes up to \$2,500. But the insured would look to the local authorities for medical care, both at home and in the hospital. This would be provided at public expense. The committee visualizes a system of clinics, which would be 'well equipped surgeries where the patient would receive the best examination, diagnosis and treatment, without the interminable periods of waiting of the average hospital outpatient department.' Around these clinics would revolve domiciliary attendance and other facilities of the public health service. The medical profession would thus become officials employed by and paid by the state.

It is interesting to compare this program with that of the Medical Practitioners' Union. As stated in *THE JOURNAL*, January 19, page 228, this body is a medical trade union, which recently affiliated with the Trade Union Congress. The medical secretary of the British Medical Association declared in a press interview that the object was "to anticipate the political movement in the country," by which he must have meant the return to power of the labor party. The Medical Practitioners' Union can therefore now be described as a constituent of the labor party. In its organ the *Medical World* it has published a lengthy memorandum advocating extension of the general practitioner service of the insurance system to the whole population. The union 'expects that private practice will continue to exist although it will be considerably restricted.' In a universal service of this kind there will be no place for any contributory system for purely medical purposes' which exists at present. But the union does not want to abolish contribution for sickness benefit (that is, the payments made to sick members), which could be regarded as one form of unemployment benefit and part of a wider problem than the problems with which the medical profession is concerned. As much of the present contribution as is applied to the provision of medical benefit should cease. Whence the money for the payment of medical benefit is to come, the union does not condescend to say. It can only be from the taxpayer, who in the view of this socialist body is a beast of burden that does not even deserve to be mentioned for the service to be put on him.

It is thus evident that the future of the insurance system is bound up in the much greater question of the future of the political situation. If the labor party should again return to power, the system will certainly become more socialistic. Probably, as suggested, medical benefit will become noncontributory and therefore free and also will be extended to the whole population. The medical profession will for the most part be state paid, if indeed its members do not become mere state officials. The British Medical Association will resist this last proposal, as its policy has always been to protect private practice against the encroachments of official practice and if on no other point the Medical Practitioners' Union will be in agreement, for it is in favor of "free choice of doctor." But what the socialist politicians may decide is another matter. There of course would still be the luxury of private practice for persons who could afford to pay for it. But they would be a disappearing class. They are already disappearing under oppressive differential taxation. An official table, just issued, shows that the number of persons with incomes exceeding \$10,000 in 1932-1933 was 84,175, the lowest for six years, the highest was in 1929-1930, when the figure was 108,532. The main cause of the excessive taxation is socialistic expenditure.

Foreigners Must Be Naturalized Ten Years Before Beginning to Practice Medicine

In the *Concours medical* of February 17 appears the draft of a bill introduced in the French house of representatives by Mr. Dommange, which will place a serious obstacle in the path of any physician of foreign birth who seeks to practice in France. In July 1934 a bill was passed and became a law to the effect that naturalized citizens could not be admitted to the bar or occupy any official position until ten years had elapsed since their becoming French citizens. The Dommange bill proposes to extend this ten year period to the medical profession in order that a physician shall during such interval become thoroughly familiar with the language and customs of the country in which he intends to practice. This proposed law is in line with the recent agitation on the part of the medical students against the constantly increasing number of foreigners in the schools and hospitals of France.

Foreign Medical Students and Physicians in France

The editor-in-chief of the *Presse medicale*, Dr. Desfosses, discussed foreign medical students and physicians in France in the February 16 issue. France has always been liberal in admitting foreign students to its medical schools. An honorary diploma, or "diplome universitaire," which did not entitle the holder to practice medicine in France has been popular with foreigners who intended to practice in their home countries. Since the war, and particularly since the limitation of students in eastern Europe, the "non-Aryan" agitation in Germany and the raising of standards for admission in the United States and other countries, a large number of foreign medical students have matriculated in the French medical schools. A treaty with Rumania, dating back to 1860, enabled students to matriculate without even being required to present a bachelor of arts degree, such as is indispensable for French students. Some of the foreign students who matriculated only with the idea of receiving an honorary degree have been able to convert it into a state license which permits them to remain in France. The number of licenses to practice in Paris granted to foreigners is gradually increasing in proportion to those given to French citizens. The French medical schools are overcrowded, so that native students find it difficult to attend lectures and to work in the laboratories and dissecting rooms.

The Arnbruster law, now in force, will virtually put a stop to foreigners practicing medicine in France, but unfortunately it cannot affect foreign students already pursuing their studies in French medical schools. It is applicable only to those matriculating last fall. The Arnbruster law left a loophole in the form of permitting citizens of those countries which do not require naturalization for French citizens who wish to practice medicine or dentistry in the respective country to do so in France. This loophole will probably be closed if the Dommange amendment becomes a law, as every one who wishes to practice medicine or dentistry will either have to be naturalized ten years before receiving such a license or, at least, have lived in France a similar length of time, even in the case of countries in which reciprocity exists, before being allowed to practice. Desfosses cites the number of foreign and French students matriculated at the various French medical schools during the 1933-1934 term. Of 1,080 students matriculating at the University of Paris Medical School for that term, 295, or over 27 per cent, were foreigners. Of 125 foreigners who received the 'diplome d'etat or state license to practice during the scholastic year 1933-1934, ninety-seven were from Rumania alone and the remainder, except three, from the central and eastern countries of Europe, three being from Egypt. None were from the United States or Canada. Of 112 students who received the honorary degree or 'diplome universitaire,' without privilege to practice, thirty-eight were from Poland, ten from Cuba, nine from Greece, eight from Bulgaria and the rest from all parts of the world, including one from the United States.

The Public Hospitals and the French Medical Crisis

The recent agitation against foreign physicians and medical students has drawn attention to the necessity of lightening the burden of the French medical profession during this period of universal economic crisis. That the influx of foreign competitors alone is not responsible for the marked decrease in income of the French practitioner is shown in the address given by Prof. Emile Sergent incident to his election as president for 1935 of one of the leading medical societies, the Societe medicale des hopitaux de Paris. The public hospitals of Paris have a capacity of 35,000 beds and are governed by the Assistance publique, corresponding to a city hospitals administration in the United States. Theoretically only nonpaying patients were supposed to be cared for but, as the result of the economic crisis and especially of the functioning of the social insurance law, the line is not as closely drawn as it used to be. The attending staffs of these free hospitals are given their positions following a strict civil service examination, based to a great extent on clinical and experimental research as well as previous internship in a Paris public hospital. The staffs are all appointed by the medical faculty of the University of Paris, following such a civil service examination (written, oral, and appraisal of previous work). These positions on the attending staffs are much sought after, because the fortunate competitors automatically become members of the medical faculty, there being only one medical school in Paris. The public, even those who are able to pay, thus feel that the best medical talent is to be found in the hospitals under the control of the Assistance publique, hence the abuse of the original object of these charity hospitals. Professor Sergent called attention to the fact that, little by little, the Assistance publique, as the result of the upheaval of social laws, has forgotten the intention of its founders and as a result the institutions under its supervision have become low priced private hospitals. Many patients who formerly could not be admitted to the charity hospitals are admitted there today, and ever increasing consultations in the outpatient departments are given gratuitously to those able to pay, whereas formerly only the indigent came for advice. On the other hand, many individuals who carry social insurance

are now cared for at home instead of entering the free hospitals. There are fewer people in these public institutions today, but those who enter them pay for their care.

The movement in France toward state medicine is making itself felt more and more every day. It will require the utmost effort of medical organizations to oppose the transformation of physicians into government officials.

Useless Petitions for Sterilization

The minister of the interior has stated that in the trying of complaints before the eugenics supreme court it has been shown that the medical officers entitled to file petitions are not showing much system in the choice of persons recommended for treatment. It is useless to burden the eugenics courts with petitions for sterilization of women more than 45 years old, alcohol addicts in the sixties, 10-year-old weak-minded children, idiots and aged catatonic patients, when persons with hereditary taints, still in the prime of life, have not been sterilized. Likewise the decisions as to whether harelip, congenital luxation of the hip or forms of polydactylism are hereditary diseases within the meaning of the law may be reserved for a later date, when all dangerous patients with hereditary taints have been sterilized. The urgent cases are weak-minded persons of all types, including also mild cases—physically healthy, vivacious males and females between the ages 16 and 40, schizophrenic and manic-depressive patients in stages of remission, epileptic persons, alcohol addicts under 50 years of age, persons presenting hereditary blindness, deafness, and the like. In every case it should be ascertained whether the patient is in the reproductive stage. It must not happen again that, after proceedings lasting for months and costing much money, the eugenics supreme court discovers that the petition should not have been entered at all.

In Hamburg 2,500 cases of hereditary disease have been handled thus far, as appears from a report of the court. The number of persons with hereditary taints in Hamburg lies between 10,000 and 20,000, out of a total population of 1,200,000. The operations are performed in eleven different clinics. The average duration of treatment ranges between three and twelve days. In the Hamburg courts 2,938 petitions have been filed, 2,107 of which demanded sterilization. Seventy-two petitions have been rejected and 1,439 operations have been carried out thus far.

CASTRATION OF FOREIGNERS

A previous letter discussed the application of the sterilization law to foreigners. A recent announcement by the highest German court of justice holds that the possibility of deporting a foreigner from Germany is not subversive of a court order demanding castration. In reaching a decision, the courts need only consider whether the foreigner affected by the petition constitutes a menace to public safety and whether the castration is necessary in order to eliminate this danger. On the other hand, it is left to the discretion of the executive boards as to whether castration may be dispensed with if a deportation order against the foreigner has been issued.

The Determination of Sex

The various theories about influencing the sex of the fetus, which have their origin only in fancy, are of little value. Modern zoology and the science of heredity hold that the sex of the fetus is determined by the spermatozoa. There are believed to be male and female spermatozoa but only one kind of ovum. Thus far no practically useful methods based on this knowledge have been announced.

A few years ago, Professor Unterberger in Königsberg published the observation that boy babies could be secured through alkalization of the vaginal secretion, an announcement that caused a sensation in the columns of the daily papers. Extensive clinical observations and experiments on man or animals, concerning which Dr Schumacher recently addressed the Gies-sen Medical Society, have shown that Unterberger's contention is not confirmed. Schumacher studied clinically more than 1,500 pregnant women. He proved that the observation of the Cologne gynecologist Professor Füh, made in a small number of cases and constantly cited in support of Unterberger's contention, cannot be substantiated. It had been maintained that in the presence of a strongly acid reaction of the vaginal secretion girl babies and in the event of an alkaline reaction boy babies predominate. The fact is that male births predominate over female births with all degrees of vaginal secretion. Since the clinical tests lent no support to the Unterberger theory, Schumacher and Günther conducted experiments on 200 female mice and 100 female rats without confirming this theory. In experiments on rabbits, in ninety litters with 514 young, alkalization of the vaginal secretion before copulation could not be shown to exert any influence on the sex. In a few rabbits, to be sure, the theory appears to find support, but in an equal number of other female animals the opposite was true. If one combines the results of the various progenies, one gets a final figure that appears to support the Unterberger theory. The predominance of males, after alkalization of the vaginal secretion of the mothers, is, however, too slight and the results of the experiments are too contradictory to justify one in drawing any definitive conclusions. Also the other figures, taking into account the laws of variations, must be regarded as due to accidental circumstances.

A practical application of this method in man is fraught with danger, since it is possible, through a chemical alteration of the vaginal secretion, to cause damage to the offspring.

The attempts to influence the sex of the fetus by treating the mother animals with sex hormones have only theoretical interest as yet and require clarification by systematic experiments on animals.

Staphylococcus Toxin

Dr J Travassos, in a recent lecture, said that staphylococcus toxin has a marked antigenic power. The blood serum of animals that have been repeatedly inoculated with small doses of toxin by the subcutaneous and intradermal routes is manifestly antitoxic. Immunization by the intravenous route is difficult because the animals, as a rule, do not withstand the inoculation of increasing doses of the toxin. The antitoxin experimentally obtained by the speaker neutralizes both in vitro and in vivo all the toxic properties of the toxin. Animals actively immunized in the speaker's experiments resisted lethal doses of toxin by intravenous inoculation and proved to be immune to intradermal inoculation of certain doses of toxin that would produce extensive necrotic lesions in nonimmunized rabbits. The speaker's results prove the preventive power of antitoxin in relation to the lethal and necrotic action of filtrates. Antitoxin protects rabbits and guinea-pigs against the effect of the toxin. The protection lasts for a certain time, which varies according to the dose of antitoxin and the route of its inoculation. Staphylococcus antitoxin has a marked preventive power against the effect of the toxin but a limited curative power. The trans-ocular and cisternal inoculation of 100, 200 or 300 units of antitoxin failed to restore the equilibrium in nine out of ten guinea-pigs inoculated five minutes after the onset of the syndrome. The action of staphylococcus antitoxin probably is

similar to that of tetanus antitoxin. The limitation of their curative action in both cases, regardless of their neutralizing effect on free toxins in the brain, is due to the fact that nerve cells more or less injured are unable to regain their integrity. Antitoxin might have a curative action in subacute intoxications of low evolution by neutralizing a small amount of toxin, as it is formed in nonextensive foci.

Gastrectomy for Duodenal Ulcer

Dr Piragive Nogueira of the Faculty of Medicine of São Paulo emphasized in a lecture the satisfactory results of gastrectomy in the treatment of duodenal ulcers, either complicated by the presence of adhesions to the head of the pancreas or perforated at this site. Injury of the common bile duct during gastrectomy is rare (four cases in 1,000 operations). The injuries were successfully corrected by the creation of anastomosis between the common bile duct and the duodenum in three cases, and by an end to end anastomosis of the common bile duct in one case. In two cases the retroduodenal part of the common bile duct formed an angle, the vertex of which was at the base of the ulcer. In a case of duodenal ulcer at a lower site, where it perforated into the head of the pancreas, the canal of Wirsung was injured, resulting in acute necrosis of the pancreas, verified at necropsy.

Test of the Hypophysis in Hyperthyroidism

Drs Mario Yahn, E. de Aguiar Whitaker and Celso Pereira da Silva recently discussed the value of the test of the hypophysis (injection of 1 cc. of extract of the posterior lobe of the hypophysis) described by Claude, Baudoin and Porak, in the diagnosis of hyperthyroidism. A group of seventeen persons, including eleven patients suffering with hyperthyroidism and six persons without it, were subjected to the test. The results were interpreted by the determination of the basal metabolism. The authors give the technical details to be followed in the test, as well as the criterion for the interpretation of results (either positive or negative). Positive results were obtained in five out of the group of eleven patients suffering with hyperthyroidism and in three of the persons without it. Claude, Baudoin and Porak reported positive results from the test in the whole group of patients with hyperthyroidism and negative results in the whole group of persons without it (thirteen and four cases, respectively). Yahn and his collaborators believe that these results may be due merely to chance and conclude that the test has no value for the diagnosis of hyperthyroidism.

Marriages

HARRY GOFF THOMPSON, Mount Vernon, Ill., to Miss Margaret Matthews of New Haven, Conn., Dec. 1, 1934

JOHN J. FLANAGAN, Newark, N. J., to Miss Helen Patricia Froehlich of Glen Ridge, February 21

SAUL H. KAPLAN, Canandaigua, N. Y., to Miss Ada Schneider of New York, March 3

JAMES A. HARPER JR., to Dr. Edna K. Seysmith, both of Greenfield, Iowa, Dec. 12, 1934

JAMES JOSEPH ROWLAND, Highlands, N. J., to Miss Dorothy M. Alton of Detroit, March 2

LACY JOHN SALAN, Washington, D. C., to Miss Marie Cecilia Rowan, Nov. 17, 1934

MARTIN T. MEYERS to Miss Marjorie Marvin Wyley, both of Atlanta, Ga., February 27

HAROLD W. KESCHNER to Miss Evelyn Clarice Silver, both of New York, March 14

SAMUEL G. SEINFELD to Miss Charlotte Lois Strumpf, both of Chicago, February 10

PAUL G. THODE, Chicago to Miss Margaret Danielson of Evanston, Ill., March 5

Deaths

Joseph Hammond Bryan ☉ Washington, D C , University of Virginia Department of Medicine Charlottesville, 1877 University of the City of New York Medical Department, 1878 member of the American Laryngological Association and the American Otological Society, fellow of the American College of Surgeons, served during the World War attending surgeon to the Episcopal Eye, Ear, and Throat Hospital consulting laryngologist to the Garfield Memorial Hospital, aged 78, died, February 3, of cerebral hemorrhage

Hilles Talley Brown, Dixon, Ill Northwestern University Medical School, Chicago, 1922, also a dentist formerly demonstrator in anatomy at the Northwestern University Dental School, on the staff of the Dixon State Hospital aged 71 died February 19 in the Veterans' Administration Hospital Milwaukee, of bronchopneumonia and coronary sclerosis

Delphus Brown Virtue, Mansfield Ohio, Starling Medical College Columbus, 1891, past president of the Morrow County Medical Society, served during the World War at one time president of the school board of Iberia formerly affiliated with the U S Veterans' Bureau, aged 68, died, February 26, of angina pectoris

George Irvine McKelway, Westfield N J University of Pennsylvania Department of Medicine, Philadelphia 1889, Jefferson Medical College of Philadelphia 1893 also a pharmacist, past president of the Medical Society of Delaware served during the World War, aged 84, died March 8

Joseph E Robins, Charlestown, W Va Jefferson Medical College of Philadelphia 1883 formerly member and president of the board of education, formerly bank president for many years member and at one time president of the state board of health, aged 73, died, January 8, of heart disease

John W Vizard, Pleasant Mills Ind , National Normal University College of Medicine, Lebanon Ohio 1892 member of the Indiana State Medical Association formerly member of the state legislature aged 65, was found dead in bed February 26, of angina pectoris

Thel Hooks ☉ Smithfield, N C , Medical College of Virginia, Richmond, 1901, formerly secretary of the Johnston County Medical Society served during the World War on the staff of the Johnston County Hospital, aged 58, died, February 18 of cerebral hemorrhage

John Buxton Loughary, Puyallup Wash Bellevue Hospital Medical College, New York, 1888 member of the Washington State Medical Association on the staff of the Puget Sound Sanatorium, aged 74, died, February 17 of cerebral thrombosis

William Marlin Marsh, Ripley Miss , University of Tennessee College of Medicine, Memphis Tenn 1915 member of the Mississippi State Medical Association aged 50 died, February 24, in the Baptist Hospital, Memphis, Tenn, of pneumonia

Robert Alexander Reid, Newton Mass , Bennett College of Eclectic Medicine and Surgery, Chicago 1877, for many years editor of the *Massachusetts Medical Journal* aged 86 died, February 5, of arteriosclerosis and cerebral hemorrhage

Arthur Eugene Roose, East Pittsburgh Pa , Jefferson Medical College of Philadelphia, 1895, member of the Medical Society of the State of Pennsylvania aged 65 died, February 22 at his home in Forest Hills, of coronary occlusion

Charles Virgil Bomar ☉ Newgulf, Texas, Chicago College of Medicine and Surgery 1917, medical director of the Texas Gulf Sulphur Company Hospital, aged 52, died, January 28, of injuries received in an automobile accident

Josiah Griffin Ely, Hamburg Conn , Bellevue Hospital Medical College, New York, 1884, for many years member of the school board, formerly member of the state legislature, aged 77, died, January 23, of pneumonia

William H Delap, La Follette, Tenn., University of Louisville (Ky) Medical Department 1910 served during the World War, aged 60 died, February 22, in the Fort Sanders Hospital, Knoxville, of streptococcal cellulitis

Montgomery Russell, Seattle, Western Pennsylvania Medical College, Pittsburgh, 1889 member of the Washington State Medical Association, aged 75 died, January 17, of pulmonary abscess following pneumonia

Walter R. Ray, Shelbyville, Ky , Louisville Medical College 1885 past president of the Shelby County Medical Society formerly member of the state legislature, aged 74, died, February 4, of heart disease

Charles E Teets, New York, New York Homeopathic Medical College, 1884, formerly professor of laryngology and rhinology at his alma mater, aged 82, died, January 7, of arteriosclerosis and myocarditis

Harry Stafford Brown, Arroyo Grande, Calif College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1906, aged 50, died, January 18, of asthma and chronic myocarditis

John Edward Pratt, Dumont, N J , Dartmouth Medical School, Hanover, N H 1878, school physician, on the staff of the Hackensack (N J) Hospital, aged 85, died suddenly, February 5, of angina pectoris

Leon Leo Hale, Chebeague Island, Maine, College of Physicians and Surgeons Boston, 1884, member of the Maine Medical Association formerly a dentist, aged 80, died, February 17, of angina pectoris

Lynn Hersley Harrison, Butler, Ind Barnes Medical College, St Louis, 1895, aged 62, died, February 22, in the Sacred Heart Hospital, Garrett, of pulmonary embolus, myocarditis and endocarditis

John Middleton, Buffalo, L R C P, Edinburgh, and L R F P S Glasgow, 1879, member of the Medical Society of the State of New York, aged 83, died, February 13, of cerebral arterial thrombosis

Joseph W Bryan, Lexington, Ky Bellevue Hospital Medical College, New York, 1873, member of the Kentucky State Medical Association, aged 85, died, February 8, of bronchopneumonia

James Edmund Brown, Bryantville, Mass College of Physicians and Surgeons of Baltimore, 1886 member of the Rhode Island Medical Society, aged 81, died, February 8, of lobar pneumonia

James Madison Reynolds, Memphis, Ind , Bellevue Hospital Medical College, New York 1885, member of the Indiana State Medical Association aged 73, died, January 10 of uremia and nephritis

Robert Camden Whitehead, Norfolk Va , University College of Medicine, Richmond, 1905 member of the Medical Society of Virginia aged 58, died, January 27 of heart disease

Joseph L Murdoch, Emerson Ga , Southern Medical College Atlanta 1893 member of the Medical Association of Georgia, aged 72 died, January 29, of lobar pneumonia

Frederick C Van Vliet, Shrewsbury, N J , University of Vermont College of Medicine Burlington 1876, aged 81, died Dec 20, 1934 of heart disease and nephritis

James Turner Rogers, Hamilton, Ont, Canada Trinity Medical College, Toronto, 1889 L R C S, L R C P, Edinburgh Scotland, 1890 died, Dec. 27, 1934

Ohan Karnak Chirmanian, New York University of the City of New York Medical Department, 1881, aged 78, died, Dec 21, 1934, of coronary sclerosis

Lelia Ada Davis, Toronto, Ont, Canada University of Toronto Faculty of Medicine, 1889, Trinity Medical College Toronto, 1895, died, January 23

Oren Cheney Tarbox, Oneonta, N Y , Bellevue Hospital Medical College New York, 1885, aged 74, died, February 12, of influenza and myocarditis

William Frederick Jackson, Brockville, Ont Canada McGill University Faculty of Medicine, Montreal, Que, 1873, aged 82, died, January 29

James Peter Valby, Sioux Falls S D , College of Physicians and Surgeons of Chicago, 1890, aged 78 died, January 23, of cerebral hemorrhage

Samuel Dutton Whitney, Albany N Y , Baltimore University School of Medicine, 1890, aged 65, died, Dec 14, 1934 of pulmonary tuberculosis

Gustave Gaston Smith, L'Orignal, Ont, Canada, Laval University Faculty of Medicine, Quebec, 1885, aged 75, died, in November 1934

J Vinson Richardson Fort Recovery, Ohio, Medical College of Ohio, Cincinnati, 1872, aged 83, died, January 29, of pneumonia

John B Cress, Knightstown Ind , Indiana Medical College, Indianapolis, 1874, aged 87, died, January 5, of myocarditis

Leland Frazier, Rupert, Idaho, St Louis University School of Medicine, 1906, aged 55 died, February 15, of erysipelas

Charles Francis Ring, Urbana, Ohio New York Homeopathic Medical College, 1881, aged 79, died, Dec 3, 1934

Edward L Locke, Hamburg, Ark (licensed in Arkansas in 1904) aged 58 died, Dec 1, 1934, of prostatitis

Correspondence

STANDARDIZATION IN TREATMENT OF BACILLURIA

To the Editor—Dr Crance in his article entitled "The Necessity for Standardization of the Treatment of Bacilluria" (THE JOURNAL, January 26, p 285) makes a definite advance by his recognition of the necessity of differentiating colon group bacilli into their two genera. This step is of such importance, especially in the evaluation of therapeutics, that it is greatly to be regretted that Dr Crance has not given information in regard to the bacteriologic details necessary for this differentiation. This cannot be done on the basis used by Dr Crance, i. e., the fermentation of sucrose. This test is employed for the differentiation of species of the genus *Escherichia*, of which our old friend *B. coli*-communior most familiarly represents the sucrose fermenting group and *B. coli*-communis the sucrose negative group (Zinsser, Hans, and Bayne-Jones, Stanhope. A Textbook of Bacteriology, 1934, p 561). Only by use of the Voges-Proskauer and methyl red tests can the generic identification be finally made. The methods for these tests are to be found in any textbook of bacteriology. Dorner and Hellingner (*J. Bact.* 29:16 [Jan.] 1935) give a comparison of methods recently developed for the Voges-Proskauer test. It has been my experience that a presumptive generic identification can be reached within twelve hours by the use of the citrate agar medium of Simmons (*J. Infect. Dis.* 39:309 [Sept.] 1926), which I have found to be invaluable, as species of *Escherichia* do not grow on this medium while species of *Aerobacter* grow rapidly and heavily. It is necessary to confirm this presumptive identification with the Voges-Proskauer and methyl red tests because of the rare citrate intermediate forms. The differentiation may be most clearly summarized as follows:

Genus	Voges-Proskauer Test i. e., Production of Acetyl Methyl Carbinol	Methyl Red Test	Growth on Citrate Agar
<i>Escherichia</i>	0	+	0
<i>Aerobacter</i>	+	0	+

It has been found in this clinic that 44 per cent of colon group urinary infections are due to species of *Aerobacter* (*J. Bact.* 17:205 [March] 1929). In colon group blood stream invasions, the incidence of *Aerobacter* jumps to about 70 per cent. Moreover, the resistance of *Aerobacter* to drugs is much higher than that of *Escherichia*. For example, mercuric chloride in broth inhibits the growth of *Escherichia* in a dilution of 1:500,000, but 1:30,000 is required to inhibit the growth of *Aerobacter*. Therefore, while we no longer consider the specific identification of colon group bacilli of clinical value, we are glad to find recognition of the importance of generic identification.

JUSTINA H. HILL, M.S., Baltimore.

Bacteriologist, the James Buchanan Brady
Urological Institute, Johns Hopkins University and Hospital

AMERICAN STANDARD INSURANCE CORPORATION

To the Editor—The American Standard Insurance Corporation of Indianapolis is circularizing New York physicians with a letter beginning "Will you accept our Physicians' Non-cancellable Full Lifetime Income Policy for TWO FULL WEEKS—at our risk and expense?"

It should interest all physicians receiving this circular material to know that the New York *Medical Week* for Nov. 10, 1934, published a report on this company's financial status as of Dec. 31, 1933, obtained from the Indiana State Insurance

Department by Dr. A. M. Rabiner of Brooklyn. Prospective clients looking forward to full lifetime non-cancellable income policy will judge for themselves as to the resources backing up these promises.

Capital	None
Income	\$19,197.27
Disbursements	20,053.36
Assets	6,562.51
Liabilities	1,039.36
Balance	5,523.15

RAMSAY SPILLMAN, M.D., New York.

COMMENT—A large number of requests have been received for information concerning the American Standard Insurance Corporation of Indianapolis. When one compares the financial standing of the American Standard Insurance Corporation, with no capital, admitted assets of something over \$6,000 and liabilities of \$1,000, with other well established companies the comparison is most unfavorable to this company.

Queries and Minor Notes

ANONYMOUS COMMUNICATIONS and queries on postal cards will not be noticed. Every letter must contain the writer's name and address but these will be omitted, on request.

ACCURACY OF TESTS FOR SYPHILIS

To the Editor—I should like to know the opinion as to the relative value of accuracy of a Kahn, Wassermann and Hinton serologic test for syphilis. Please omit name.

M.D. Texas

ANSWER—The relative accuracy of different tests for syphilis in this country will soon be evaluated under the auspices of the U. S. Public Health Service, jointly with the American Association of Clinical Pathologists (The Evaluation of Serologic Procedures for the Diagnosis of Syphilis, editorial, THE JOURNAL, Oct. 29, 1934, p 1237. Cumming, H. S., Hazen, H. H., Sanford, A. H., Senear, F. E., Simpson, W. M., and Vonderlehr, R. A. The Evaluation of Serodiagnostic Tests for Syphilis in the United States, *ibid.*, Dec. 1, 1934, p 1705). Approximately 1,000 comparable specimens of blood and spinal fluid will be submitted to authors of different methods or modifications from about December 1934 to March 1935 for serologic examination. Each worker will utilize only one designated method. The final results, to be submitted to the U. S. Public Health Service, should indicate which method is the most satisfactory. Meanwhile the important criteria available for judging Kahn and Wassermann tests are summarized in two reports by the League of Nations (League of Nations, Health Organization, Conference on Serodiagnosis of Syphilis held at Copenhagen, Geneva, 1928, Conference on Serodiagnosis of Syphilis held at Montevideo, Geneva, 1930). The report of the Montevideo conference refers to the Kahn reaction as being "absolutely specific and extremely sensitive" and superior to the Wassermann tests used at both conferences. Since the completion of those conferences, Wassermann procedures have generally been improved on and new precipitation methods have been presented. Reports on the Hinton test are comparatively limited in number. Burdon and Duggan (*Am. J. Syph.* 17:110 [Jan.] 1933) obtained comparable results with the Hinton and Kahn tests. A highly reliable Wassermann technique should compare favorably with either one of these two precipitation methods.

TOXICITY OF HEMATOPORPHYRIN

To the Editor—The question has been asked me whether the mode of murder in a recent murder story was possible and I must ask you. The victim was given hematoporphyrin and death occurred when he went out into the sunshine. Would it be possible for one to get sufficient hematoporphyrin for that to occur? I doubted it but could not be sure. Please omit name.

M.D. Louisiana

ANSWER—Observations on animals as well as on human beings indicate that hematoporphyrin may cause serious symptoms and even death under certain conditions. When mice are given hematoporphyrin by subcutaneous injection and then exposed to light, the skin will become livid or red and death will occur sooner or later from failure of respiration and fall in the blood pressure (Hausmann, W. Die sensibilisierende Wirkung des Hämatoporphyrins, *Biochem. Ztschr.* 30:276, 1911). A boy, aged 3 years, was injected intramuscularly with 0.12 Gm. of hematoporphyrin in 80 cc. of weak solution of sodium hydroxide. Two and one-half hours later he was

exposed to a medium bright sun for twelve minutes, and four hours later the skin was markedly reddened. A week later the injection was repeated and this time exposure to sun of medium intensity for ten minutes produced a rather dangerous erythema with marked edema, blisters of varying size and a rise in temperature to 103.5, also headache (Strach C B Photosensitization, *Am J Dis Child* 40:800 [Oct] 1930). In view of these observations it seems reasonable to conclude that hemirporphyrin might cause death under such circumstances as are outlined in the question. There does not seem to be any good reason to believe that it would be impossible to obtain enough hemirporphyrin to cause death in a human being, especially if injected subcutaneously.

VERTIGO AFTER MOTOR ACCIDENT

To the Editor—A man aged 45 on July 1 1934 had an automobile accident and was struck on the left side of the head in the temporoparietal region. The patient was unconscious for a few hours but roentgen examination showed no fracture, only a scalp wound. He left the hospital after a few days feeling well and resumed his work at the factory. While walking in the street he blew his nose and suddenly was seized with an attack of vertigo and fell. The vertigo passed away and he resumed on upright position and continued to his work. Since then he has noticed that sneezing or blowing the nose or lifting a weight produces a transient vertigo. He does not fall but has learned to be cautious as otherwise he feels that he might. At the time of the accident there was no history of any bleeding from the nose or ears. Examination now shows both ear drums intact with no impairment of hearing. There is no spontaneous nystagmus. Flexing the head on the chest does not induce the vertigo. The eustachian tube on the left side is closed or only partially patent. Nasal respiration is free. Several catheterizations have been done with no improvement as yet. What have you to suggest as a cause or in the way of treatment? Please omit name.

M D Michigan

ANSWER—It is quite possible that the vertigo in this case is due to a caloric reaction. Blowing the nose violently may introduce a considerable quantity of air into the middle ear by way of the eustachian tube, and in some instances this causes a reaction of the vestibular apparatus the same as when cold air, or hot or cold water is introduced into the external auditory canal. When the labyrinth is cooled by such a procedure the rapid component of nystagmus is to the opposite side, and the patient falls toward the same side as the ear that is stimulated. When heat is used, the opposite reaction occurs. So far as the symptoms are concerned when lifting a weight, it is possible that some vascular disturbance in the labyrinth causes these. There is no definite treatment, except the avoidance of the excessive blowing of the nose and violent exercise.

RADICULITIS

To the Editor—A woman aged 70 has had a backache located in the right sacro-lumbar region and pain in the right thigh and leg for the past year. The pain often keeps her up at night and she has lost 25 pounds (11 kg) during this time. The right knee jerk is absent. The Babinski sign is negative. Her leg is so weak that she can walk only with the aid of a cane. There are no bladder or rectal symptoms. A chronic cystitis, which she had responded to silver nitrate irrigation. Roentgen studies of the pelvis and gastro intestinal tract a blood count the blood Wassermann test, and the blood urea and uric acid were all normal. She was found to have mild diabetes with a fasting blood sugar of 168 mg per hundred cubic centimeters. Under treatment with diet and insulin the glycosuria is easily controlled and she has gained back 10 pounds (4.5 kg) but no remedies thus far (local heat adhesive strapping of the pelvis infra red analgesics epidural block with procaine hydrochloride and physiologic solution of sodium chloride) have had any value in relieving the back and leg pain. A neurologist has diagnosed the condition as a lumbar radiculitis of either inflammatory or toxic origin. There are no apparent foci of infection. Are there any other therapeutic means of relieving her pain? What is the outlook for permanent relief of these pains? Will she recover the use of her right leg? Kindly omit name and address if published.

M D New York

ANSWER—Neurologic study has presumably excluded the possibility of an intraspinal lesion compressing the nerve roots and has shown the absence of spinal fluid block. The continued unilaterality of the symptoms and the absence of vesical and rectal disturbance tend to confirm this. Hence it appears that the radiculitis is associated with the diabetic condition, a possible arteriosclerosis or an osteo-arthritis. In the first case there should be improvement with alleviation of the diabetic state, though there may be a prolonged course. In the other conditions the main therapeutic effort is with the general state of health. Suggestions for therapy other than those already followed concern rest, possibly with extension of the limb, massage, climatic adjustment, baths and sedative forms of electric current. An exact answer to the second and third questions is not possible without more precise diagnosis, but many such cases do show amelioration and some recovery even after a prolonged duration.

MAPPING MOTOR FIELDS

To the Editor—Please give me information concerning the method of mapping out the efficiency of muscle function according to your industrial motor field chart. I have some of your charts for recording the results of this examination but would like to know the apparatus necessary to perform the test. I am aware of the fact that these twenty squares are placed on a blackboard but do not know the size of each square the size of the test object used or the distance the patient is seated from the blackboard. Information concerning this matter will be highly appreciated by me.

E O ALVIS MD, Indianapolis

ANSWER—No special apparatus is required for mapping the motor field. This procedure is best carried out with the patient seated about 1 meter away from a blank wall. The twenty squares are mapped out roughly on the wall in an area 6 feet vertically and 8 feet horizontally, thus making each square approximately 13 by 18 inches. The target used should be a minute point of light, preferably the shielded light of a self-luminous ophthalmoscope. A red glass is held before one eye of the patient, whose head should be held rigidly in the primary position. The light is then shown in each square consecutively and, when diplopia is announced by the patient, it should be recorded on the motor field chart.

EVOLUTION

To the Editor—In THE JOURNAL Nov 24 1934 page 1626 second paragraph appears the statement: "Is Darwin's principle of the elimination of the unfit and the survival of the fit the only explanation?" Darwin relied on inheritance of the effects of use and disuse as an aid in natural selection but the evidence of genetics shows conclusively that these effects are not inherited. I'll bet dollars to rotten apples that Darwin did not say that and I'll eat my words if you will tell me where he says it. If there is one thing that Darwin and Sir Alfred Russel Wallace both stressed in contradistinction to Lamarck it was that acquired characteristics could not be transmitted, that use or disuse played not a single role in heredity by reason of the fact that the germ cells of a future generation were intact before the fetus was fully developed or born.

O R HAGEN, MD Patterson N J

ANSWER—The editorial in question was based wholly on Professor Conklin's lecture on progress in the study of evolution (*Science* 80:147 [Aug 17] 1934). Professor Conklin says that, in the old evolution of Lamarck and Darwin, "attention was fixed upon the developed organism and evolutionary changes were supposed to be first made in the adult and then by some mysterious process to be transferred to the germ cells, in the newer views of evolution changes are first wrought in the germ cells and only later appear in the developed organism." Professor Conklin also points out that Darwin and many others sought refuge "in the inherited effects of use and disuse as an aid to natural selection, but this refuge is now denied us, for the evidence from genetics are conclusive that such effects are not inherited." It is not claimed that Darwin made any particular statement, the object of the editorial was only to summarize as correctly as possible Professor Conklin's discussion.

ANTITYPHOID VACCINATION IN CHILD GOING TO PUERTO RICO

To the Editor—Would it be wise or essential to administer typhoid paratyphoid vaccine prophylaxis to a 6 year old child who expects to spend the winter in Puerto Rico?

EDWIN P RUSSELL, MD Rome N Y

ANSWER—It is certainly advisable to immunize this child against typhoid. Since rather severe reactions sometimes follow the administration of the vaccine, it would be wise to begin with one third of the usual dose, giving the vaccine in five or six injections. The Puerto Rican Health Bureau reports show that there has been no recent epidemic of typhoid but that the disease is endemic. The number of cases reported during the last two years has varied from seven to thirty-five monthly. In 1931 the mortality rate was 66 per hundred thousand, in 1932, 51.

X-RAYS IN PROSTATIC HYPERTROPHY

To the Editor—Has treatment with x-rays ever been successful in reducing the size (and thus giving better bladder drainage) of a non-malignant hypertrophied prostate? I have been told that it will reduce uterine fibroids in size. Why will it not reduce the size of the prostate?

G B TIMBERLAKE MD, Atlanta, Ga

ANSWER—The use of x-rays in the treatment of benign hypertrophy of the prostate has not been successful either in reducing the size of the gland or in relieving the obstruction or symptoms. X-rays have been successfully used to reduce the size of uterine fibroids. An explanation does not seem to have been given for the fact that they work in fibroids and not in the prostate.

TREATMENT OF TABETIC PAINS

To the Editor—In case of tabes dorsalis in a woman aged 50 of a number of years duration having had antisyphilitic treatment years ago and at present a negative blood and spinal fluid Wassermann reaction, what is the best analgesic for the relief of severe lightning pains of the extremities (morphine nauseates coal tar products take too long)? What may be used in place of intravenous trypanasamide when the veins are too small (she is receiving iodobismutol and iodides)? Please omit name.

MD New York

ANSWER—From the question it is judged that the pains are so severe as to make life unbearable. Consideration may then be given to the use of such measures as the epidural (not intradural) injection of physiologic solution of sodium chloride, with or without the addition of small amounts of procaine hydrochloride. Sometimes these will result in prolonged remissions. When the pain is so severe as to cause exhaustion it may be necessary to resort to division of the pain tracts in the cord, either by chordotomy or by division of the posterior commissure. These are dangerous procedures and must be carried out by an experienced neurosurgeon. There are no substitutes for trypanasamide that can be administered orally. Consideration might be given to the use of pyretotherapy the results of which are variably reported.

INSOMNIA IN AGED

To the Editor—A woman aged 86 is suffering with chronic insomnia. Once she gets a good night's sleep she is up and about the next day feeling fine. Without a good night's sleep she is miserable the whole day. She has a chronic myocarditis and a chronic gastritis of some sort and gets along well on a milk and egg diet though there is no definite evidence of ulcer of the stomach. The blood pressure is 160 systolic 90 diastolic. There are no other significant physical manifestations. She requires large doses of hypnotics 80 grains (5 Gm.) of sodium bromide does not avail. It takes 9 grains (0.6 Gm.) of sodium amylal or oriol to put her to sleep for several hours and she has to have it every night. Kindly suggest the best thing to do in this case. Please omit name.

MD New York

ANSWER—Treatment for insomnia in the aged is always a difficult and individual problem. It may be necessary to continue the use of the hypnotics that are found to be efficacious. Sometimes small doses of alcohol will produce the desired effect. This treatment may be combined with advantage in some cases with paraldehyde. It is assumed that attention has been given to general hygienic measures and predormital occupation.

UNION OF SKULL SUTURES IN INFANT

To the Editor—In Queries and Minor Notes in THE JOURNAL, December 29 1934 page 2046 you answered an M.D. from California on the question of premature osseous union of skull sutures in a 10 weeks old infant. You stated that this was probably secondary to failure of brain growth and led to the group called microcephalic. I am sure you are correct in this statement but I do not feel that the question was fully answered.

It is known that oxycephaly and acrocephaly which are due to premature synostosis of the sutures can lead to feeble-mindedness (Bronfenbrenner A. N. Oxycephaly as a Pathogenic Entity *Am J Dis Child* 42: 837 [Oct.] 1931) also that the condition if found early enough may be amenable to surgical intervention (Gilman in Cabot Case Reports *New England J Med* 204: 274 [Feb 5] 1931).

Although I know of no reports in infancy it is conceivable although very improbable that this mechanism may be at play in the questioned case. The M.D. should be able to rule out this remote possibility by:

1. Feeling of the sutures which at this age are open giving a flexibility to the skull plates.
2. A fundus examination.
3. A lumbar puncture.

B. BARRETT GILMAN, M.D. Boston

Epidemiologist Commonwealth of Massachusetts
Department of Public Health

POSSIBLE HYPERINSULINISM

To the Editor—In answer to a query of a Texan physician entitled Vomiting in Childhood which appeared in THE JOURNAL, January 26 the differential diagnosis included recurrent or cyclic vomiting allergic reaction or overfeeding and appendicitis. The syndrome as given was of a well boy aged 6 years who while playing suddenly goes to his mother complains of nausea vomits then becomes completely relaxed and pale and has a bowel movement. This is followed by a short sleep of two or three hours following which the child is apparently well. If these symptoms follow close on one another in approximately the same sequence each time the child has an attack and the whole picture covers a comparatively short period of time every month or so I think it is well to consider also in this case a type of petit mal or possibly a so-called epileptic equivalent. Because of the voracious appetite it would be well to exclude a possibility of hyperinsulinism. The child may have enough dextrose to keep all symptoms in abeyance until he overexerts himself such as in playing and running about when he may develop a temporary hypoglycemic state.

MICHAEL A. BRESCHIA, M.D. Queens N.Y.

Medical Examinations and Licensure

COMING EXAMINATIONS

AMERICAN BOARD OF DERMATOLOGY AND SYPHILIOLOGY. Written (Group B candidates). The examination will be held in various cities throughout the country April 29. Oral (Group A and Group B candidates). New York June 10. Sec. Dr. C. Guy Lane, 416 Marlborough St. Boston.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY. Final oral and clinical examination (Group A and Group B candidates). Atlantic City N.J. June 10-11. Sec. Dr. Paul Titus, 1015 Highland Bldg. Pittsburgh.

AMERICAN BOARD OF OPHTHALMOLOGY. Philadelphia June 8 and New York June 10. Applications must be filed before April 10. Sec. Dr. William H. Wilder, 122 S. Michigan Blvd., Chicago.

AMERICAN BOARD OF OTOLARYNGOLOGY. New York June 8. Sec. Dr. W. P. Wherry, 1500 Medical Arts Bldg. Omaha.

AMERICAN BOARD OF PEDIATRICS. Atlantic City N.J. June 10 and St. Louis Nov. 19. Sec. Dr. C. A. Aldrich, 723 Elm St. Winnetka Ill.

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY. Philadelphia June 7-8. Sec. Dr. Walter Freeman, 1726 Eye St. N.W. Washington D.C.

AMERICAN BOARD OF RADIOLOGY. San Francisco May 10-12 and Atlantic City N.J. June 8-10. Sec. Dr. Byrl R. Kirklin, Mayo Clinic Rochester Minn.

ARIZONA. Phoenix April 23. Sec. Dr. J. H. Patterson, 826 Security Bldg. Phoenix.

ARKANSAS. Basic Science. Little Rock May 6. Sec. Mr. Louis E. Gebauer, 701 Mam St., Little Rock. Regular. Little Rock May 14. Sec. Dr. A. S. Buchanan, Prescott. Elective. Little Rock May 14. Sec. Dr. L. L. Marshall, 820 W. 14th St. Little Rock.

CALIFORNIA. Reciprocity. San Francisco May 15. Sec. Dr. Charles B. Pinkham, 420 State Office Bldg. Sacramento.

COLORADO. Denver April 3. Sec. Dr. Wm. Whitridge Williams, 422 State Office Bldg. Denver.

IDAHO. Boise April 2. Commissioner of Law Enforcement, Hon. Emmett Pfost, 203 State House Boise.

ILLINOIS. Chicago April 9-11. Superintendent of Registration Department of Registration and Education Mr. Eugene R. Schwartz, Springfield.

MINNESOTA. Basic Science. Minneapolis April 23. Sec. Dr. J. Charnley McKinley, 126 Willard Hall, University of Minnesota. Minneapolis. Medical. Minneapolis April 16-18. Sec. Dr. E. J. Engberg, 350 St. Peter St. St. Paul.

MONTANA. Helena, April 2. Sec. Dr. S. A. Cooney, 7 W. 6th Ave. Helena.

NATIONAL BOARD OF MEDICAL EXAMINERS. The examination will be held in all centers where there are Class A medical schools and five or more candidates desiring to take the examination June 24-26. Ex. Sec. Mr. Everett S. Elwood, 225 S. 15th St. Philadelphia.

NEBRASKA. Basic Science. Omaha May 7-8. Dir. Bureau of Examining Boards Mrs. Clark Perkins, State House Lincoln.

NEVADA. Carson City May 6. Sec. Dr. Edward E. Hamer, Carson City.

NEW MEXICO. Santa Fe April 8-9. Sec. Dr. P. G. Cornish Jr., 221 W. Central Ave. Albuquerque.

OREGON. Basic Science. Portland May 18. Sec. Mr. Charles D. Byrne, University of Oregon Eugene.

RHODE ISLAND. Providence April 4-5. Dir. Department of Public Health Dr. Edward A. McLaughlin, 319 State Office Building Providence.

Florida November Examination

Dr. William M. Rowlett, secretary, Florida State Board of Medical Examiners, reports the examination held in Tampa Nov. 12-13, 1934. Sixty candidates were examined, 39 of whom passed and 21 failed. The following schools were represented:

School	PASSED	Year Grad	Per Cent
College of Medical Evangelists	(1931)		79.4
Yale University School of Medicine	(1931)		82

Book Notices

Treatment by Diet. By Clifford J. Harborka, B.S., M.S., M.D., Department of Medicine, Northwestern University Medical School, Chicago. Cloth. Price, \$5. Pp. 615 with illustrations. Philadelphia & London: J. B. Lippincott Company, 1931.

Perhaps no field of human thought has become permeated with more sentiment and prejudice than the subject of dietetics. Accordingly, it is refreshing to read a book in which sound judgment and logical thinking born of practical experience replace lengthy accounts of theories developed by food faddists with their pseudoscientific gestures to promote health. For a long time there has been a need for a book on dietetics for physicians that would stress the elementary principles of nutrition and relate their practical application to clinical medicine. This book comes as close to meeting this need as any that has appeared recently. It is concise in organization, the data are unusually complete but simply and clearly stated and the manner of presentation is systematic and practical. The book is divided into five parts. In the first part the author gives a brief but adequate discussion of diet in health. The following part is concerned with the application of dietotherapy and affords the physician an excellent method of teaching the patient to visualize definite portions and servings of various foodstuffs. The third part is devoted to diet in disease and uniquely divided into conditions in which diet is of paramount importance and diseases in which diet is of varying importance. Such a manner of presentation assumes a clinical background and the author is well prepared by virtue of his long experience in hospital work and private practice. The fourth section is devoted to routine hospital diets and special methods of feeding. The concluding section deals with standard weight charts, tables of equivalents, approximate weights and measures, and other useful information for the physician in instructing the patient for the diet prescribed. A well chosen bibliography of current and standard literature in the field of nutrition is given at the end of the book. Every physician in the practice of medicine should find this work a helpful adjunct to his other books on treatment. It is written especially for him, anticipating his practical need and sparing him of much useless and controversial data, so often found in textbooks of this type. Wherever possible the author has resorted to tables and outline, so the essence of his subject will be readily apparent. While any one interested in dietetics can profit from his book, the man in the actual practice of medicine will welcome it.

Néphropathies et néphrites. Leçons cliniques. Par F. Rathery, professeur à la Faculté de médecine de Paris. Paper. Price 45 francs. Pp. 208. Paris: Librairie J. B. Baillière et Fils, 1934.

This is written in the form of clinical lessons, so popular in France since the days of Trousseau. The method has certain didactic advantages, particularly for the practicing physician and advanced student, in that it facilitates concentration on special topics and the presentation of the individual point of view of the author. On the other hand, the lecture is less well adapted to the systematic elucidation of a broad subject. The book has the advantages and disadvantages of its expository method. The reader who is already tolerably well oriented in the field will probably find considerable food for thought in the author's experiences and points of view on the subjects considered: precocious arterial hypertension, hypertensive crises in the course of chronic nephritis, juvenile albuminuria, changes in the proteins and lipids of the plasma in nephritis, nephritis

with hyperchloremia, malignant chronic nephritis in the adolescent, pure azotemic nephritis, acute nephritis and erythema nodosum, renal amyloidosis, renal diabetes, and nephrotic syndromes in the tuberculous. However, none of the subjects are considered in detail, and some of the conclusions seem based on insufficient evidence. Certain of Rathery's conceptions are in diametrical contradiction to those dominant in this country. He believes that hypertension is most often a result of disease of the kidney. There is insufficient discrimination between those forms of hypertension which are the result of inflammation of the kidneys and those which are of extrarenal genesis. Following in the tradition of Widal, renal disease is largely classified on the basis of whether nitrogen or chloride is retained, with only secondary consideration of the nature of the process in the kidneys. Chronic appendicitis is stated to be a frequent cause of renal lesions, but there is no supporting evidence. There is some interesting casuistic material in the book. Some of the data regarding the individual lipid fractions in the plasma and the chloride content of the red cells and plasma in various forms of renal disease may be of value to American readers. Rathery rightfully emphasizes that the chloride content of the red cells is not necessarily an accurate index of the concentration of chloride in the tissues in general, an assumption made by some investigators.

What About Sterilization? A Series of Eight Articles Discussing the Question from the Moral and Scientific Points of View. By Rev. Ignatius W. Cox, S.J., and James J. Walsh, M.D., Ph.D. Paper. Price 15 cents. Pp. 31. Washington, D. C.: National Catholic Welfare Conference, 1934.

This is a fusion of medical and biologic science with religion, the latter dominant. Sterilization under any and all conditions is unqualifiedly condemned "as an invasion of God's exclusive dominion over man's faculties." On the strictly scientific side the pamphlet does not give fairly the views of such competent biologists as Professor Jennings, who admits that the sterilization of definite mental defectives will reduce mental defectives in society by a considerable percentage. The pamphlet is also in conflict with the famous ruling of the late Justice Holmes of the United States Supreme Court: "Three generations of imbeciles is enough."

The Practice of Dietetics. By L. H. Newburgh, M.D., Professor of Clinical Investigation, the Medical School, University of Michigan, Ann Arbor, and Frances Mackinnon, A.B., Dietitian, Diet Therapy Clinic, University Hospital, University of Michigan. Cloth. Price \$4. Pp. 264. New York: Macmillan Company, 1934.

This book is presented in three parts, the first discussing the needs of the body, the second the methods of selecting these materials, and the third the problems associated with the use of diet in the control of disease. The book is written primarily for the doctor and the dietitian rather than the average lay reader. It is a scientific consideration of the subject and quite up to date. Its chapters on therapy are concerned largely with the dietary control of diabetes and of renal disease. There is no attempt to provide recipes or menus, but rather to give enough information about the disease concerned and the foods to be used to permit an intelligent physician to prescribe scientifically for his patient.

Lectures on Medical Electricity. By Elkin P. Cumberbatch, M.A., B.M., D.M.R.E., Medical Officer in Charge, Electrical Department and Lecturer on Medical Electricity, St. Bartholomew's Hospital. Cloth. Price 6/- Pp. 236 with 38 illustrations. London: Henry Kimpton, 1934.

As in his book "Essentials of Medical Electricity," Dr. Cumberbatch pays greatest attention to the subject of the galvanic current. Eight out of the twelve lectures contained in the book are devoted to this subject. Medical and surgical diathermy, the static current, infra-red, and visible and ultra-violet radiation are covered in the remaining four chapters. The emphasis placed on the galvanic current is out of proportion to its relative use in actual medical practice. The lectures are written in colloquial manner with the injunction to "be down the following note." These notes are printed in a style differing from that of the general text. This style, next or simplicity and clarity. With the exception of the subject of galvanic current, the subject matter of the book, though it is of value to the medical student, is covered in a manner to permit it to be of any great value to the practitioner of medicine.

Our Heritage and Other Addresses By Colonel Hon Herbert A. Bruce R.A.M.C. M.D. L.R.C.P. Lieutenant Governor of Ontario Cloth Price \$2.50 Pp 392 Toronto The Macmillan Company of Canada Ltd 1934

In chronological order Dr. Bruce presents addresses delivered by him as lieutenant governor of Ontario from Dec. 31, 1932, through November 1934. The addresses cover almost every phase of human interest. Of particular medical interest are those on the romance of surgery, sterilization of the feeble-minded, cheaper convalescence, medicine acknowledges no national barriers, quacks versus science, cost of convalescence, the literary practices of some medical practitioners, and numerous addresses on such subjects as housing and education which are in the field of social medicine. The point of view of Dr. Bruce is unusually sound and yet fairly advanced. He writes directly and simply. Unfortunately some of the addresses are pointed for the occasion on which they were given and will have but little interest for those who read them in this collection.

Medicolegal

Malpractice Baldness Attributed to Roentgen Treatment—The patient had a small sore on the crown of her head which the appellant physician diagnosed as favus. He administered three roentgen treatments to her head. As a result of the negligent administration of the treatments, it was alleged, the patient suffered a severe burn resulting in permanent baldness of most of her head. The father, as next friend of the patient, his minor daughter, sued the physician and obtained judgment in the trial court. The physician appealed to the court of civil appeals of Texas, Austin.

The physician contended that the baldness was due to the disease. He testified that the first treatment was for five minutes on the sore spot, the second for five minutes each on five different areas in the region of the sore spot, and the third for eight minutes on the sore spot. He and other experts testified that this was the proper method of roentgen treatment. The girl's parents, who accompanied her at the time of each treatment, testified that the first treatment was from fifteen to thirty minutes, the second for one hour and a half, and the third for a longer period of time than eight minutes. After the second exposure, or treatment, according to the testimony, the girl's head began to turn red and blisters appeared. Later the head became as "a piece of raw meat" and continued so for several months, causing her great pain, and in the end sloughed off to the bone, leaving her bald. The testimony of the experts as to whether favus would cause complete baldness conflicted. Some testified that in extreme cases it would, while another testified that only the immediate hair involved would die. After examining the girl's head before the jury, one of the experts testified that her baldness was caused by a burn and that she would be permanently bald. The doctrine of *res ipsa loquitur*, said the court, is not involved in this case and under the evidence it was clearly a question for the jury to determine whether the injuries were caused by the physician's negligence.

The physician further contended that the court erred in permitting a picture from a medical textbook to be exhibited to the jury to test the weight to be given to the testimony of an expert witness called by him. This witness testified that a favus infection might produce complete or splotched baldness, depending on the extent and severity of the infection, and that the straight lines of demarcation of the bald and hairy portions of the girl's head were a mere coincidence, in that the infection of hair follicles happened to stop at the straight lines. On cross-examination, this witness testified that a certain textbook on roentgen rays was a standard authority. He was shown a picture in the textbook as typical of baldness caused by favus infection, which he said showed a moderate infection, because the patient had hair scattered over his head. Over objection, the picture was exhibited to and inspected by the jury. The rule is settled, said the court, that the knowledge and qualification of an expert witness may be tested as against accepted authorities on the subject testified about. The same rule should apply to a picture as to the written text.

There was sufficient evidence, the court said, that the girl would suffer physical discomfort in the future because of her baldness, and the trial court did not err in submitting such discomfort as an element of damages suffered by her. The judgment of the trial court was affirmed.—*Hess v Millsap (Texas)* 72 S.W. (2d) 923

Current Medical Literature

AMERICAN

The Association library lends periodicals to fellows of the Association and to individual subscribers to THE JOURNAL in continental United States and Canada for a period of three days. Periodicals are available from 1925 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 12 cents if two periodicals are requested). Periodicals published by the American Medical Association are not available for lending but may be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk () are abstracted below.

Survey of Training Courses for Laboratory Technicians in General Hospitals. H. Ikeda. St. Paul —p. 64

Antigens for Modification of Wassermann Test.—Kolmer states that the acetone insoluble lipoids recovered from the ether extractions of beef heart powder in the preparation of the Kahn antigen have definite antigenic value. The addition of 2 Gm. of these lipoids to the Kolmer cholesterolized and lecithinized alcoholic extract of heart definitely increases its antigenic sensitiveness with a slight or no increase in the anticomplementary activity. A simplified or alternative method of preparing this antigen reinforced with 2 Gm. of lipoids per hundred cubic centimeters is described. This simplified antigen is preferred because it is more antigenic and simpler and easier to prepare. Because of its higher antigenic sensitiveness the author recommends the use of 20 antigenic units instead of 10 units of either antigen in performing the Kolmer modification of the Wassermann test. These antigens in a dose of 20 antigenic units increase the sensitiveness of the Kolmer complement fixation test for syphilis while preserving its higher specificity or freedom from falsely positive reactions when the test is conducted as described originally.

Portal Cirrhosis. Combined Medical and Surgical Management. Report of Instance. H. A. Rusk and H. C. Newman. St. Louis —p. 819

Experimental Production of Cholecystitis.—For the experimental production of cholecystitis, Rehfuess and Nelson obtained organisms in pure cultures of hormone broth from areas clinically believed to be diseased: nasal discharges, abscessed teeth, gums, tonsils, bile, urine, prostatic secretion and colon walls. Subcultures on agar mediums were preserved at refrigerator temperature as sources from which subsequent cultures were obtained. It was their desire to produce chronic

lesions more like those which one would expect to occur from a focal area that probably throws into the blood stream at varying intervals a small number of organisms or their by-products. Small, ascending amounts were injected into rabbits' ear veins usually beginning with 0.02 cc. of the six-hour culture. These were repeated in larger doses once or twice a week depending on whether or not there were signs which would lead one to believe that the rabbits were sick. Prior to each injection the cultures were examined and smears were made in order to be sure that contamination had not occurred. Postmortem examinations were performed on the rabbits after from two to ten months, except in the case of a few that died or were killed because of extreme illness. Histologic observations illustrate the engorgement of blood vessels, distention of the gallbladder, thickening of the wall and the leukocytic infiltration. Such were the observations in varying degrees of those considered to be diseased gallbladders. Of the several hundred animals that had not received bacterial injections none presented gallbladders similar to those considered to be diseased. With one exception diseased gallbladders were found after the injection of a variety of organisms obtained from various focal areas. Twenty-five per cent of the rabbits were so affected. Organisms were recovered at times from the bile of gallbladders believed to be grossly normal. The route by which bacteria reach the gallbladder in the majority of instances appears to be by way of the blood stream. In general, from this study the authors believe that almost half of the cases of gallbladder disease seen clinically are bacterial in origin.

Studies in Gastric Secretion.—Winkelstein studied the curve of gastric secretion during the night in 169 patients. He observed that normal persons have little or no free hydrochloric acid during the night. Patients having duodenal, gastric and jejunal ulcer have a high nocturnal curve and a high titer of free acid. In gastric neuroses there is a low nocturnal curve of secretion. In gastric carcinoma the gastric contents during the night resemble those found in the usual day test meal: i. e. a low acidity with increased mucus and blood. The nocturnal hypersecretion and hyperchlorhydria in peptic ulcer cannot be controlled by alkalis, olive oil, atropine and aspiration. In the author's opinion the best medical method of controlling the gastric secretion during the night is the milk drip. Surgically, partial gastrectomy frequently accomplishes the same result. He discusses the significance of these observations particularly in the problem of peptic ulcer and emphasizes the injurious effect on the gastric mucosa of an increased fasting or interdigestive secretion.

Repeated Attacks of Experimental Pneumococcal Pneumonia—Coggeshall and Robertson studied the effects of repeated attacks of lobar pneumonia produced by the intrabronchial injection of pneumococcus type I in twenty-five dogs undergoing seventy-eight infections induced at intervals of from three days to nineteen months. The number of attacks to which animals were subjected ranged from two to eleven. The dogs were killed during the final infection and the pulmonary pathologic changes were studied. That recovery from the experimental disease conferred on the animal increased resistance against subsequent infections was shown by the fact that such animals regularly survived doses of culture which in the dog infected for the first time produced a fatal outcome. The recurrent attacks of pneumonia were uniformly mild in character; the febrile course was brief, the pulmonary lesion was usually confined to a single lobe and bacteremia seldom occurred. The time intervals between attacks bore no relationship to the severity of the experimental disease. Tests for acquired antipneumococcal immune substances in the blood after recovery showed their presence in some animals and not in others; yet dogs without demonstrable humoral immunity appeared to be just as resistant to reinfection as those possessing it. Secondary lesions produced in the lobe previously affected tended to evolve much more rapidly than did the primary ones. They were characterized by the early appearance of a generalized macrophage reaction and a marked diminution in the numbers of pneumococci in the tissues or their complete absence. These changes occurred more slowly in secondary lesions initiated in heretofore uninvolved lobes. The macrophage reaction which consists of a swelling of the fixed tissue cells (histiocytes) and a subsequent liberation of macrophages into the alveolar exudate, is regarded as a significant evidence of increased antipneumococcal resistance, since it has been observed to occur regularly at the time of recovery from the first infection and is accompanied by the local disappearance of the invading micro-organisms.

Tests for Hypersensitiveness After Recovery from Experimental Pneumonia—Coggeshall bases his conclusion that dogs do not develop hypersensitivity to the pneumococcus as the result of experimental lobar pneumonia on the following: 1 Fifteen dogs were given type I and II pneumococcus lobar pneumonia and following recovery, were tested for hypersensitiveness by means of intrabronchial and intracutaneous injections of the autolysate made from the homologous pneumococcus. 2 Seven dogs showed a pulmonary lesion discernible with the x-rays at the site of the autolysate inoculation; three of these dogs were normal controls. 3 No evidence of a positive skin reaction was found in any of the fifteen dogs; many of which received repeated infections and intradermal autolysate injections. 4 Subsequent infections in the same animals were

definitely milder than the initial infection. 5 The infections following the administration of intrapulmonary and cutaneous autolysate were of about the same intensity as the initial infection. 6 Temperature, pulse rates, white blood counts and differential blood pictures showed no significant variations following intrapulmonary injection of autolysate. 7 Tests for the acquisition of humoral immune bodies following autolysate injection and recovery from the experimental disease showed the presence of these substances in some of the dogs and their absence in others. 8 Study of the pathology of the pulmonary lesions produced by the autolysate failed to reveal histologic changes characteristic of an allergic reaction. However, the presence of perivascular accumulations of large mononuclear cells observed in the lesions of the recovered dogs does suggest a locally accelerated reactivity of the fixed tissue cells to the products of the pneumococcus.

Method for Analysis of Dust Samples—Bale and Fray believe that their method of employing x-ray powder spectroscopy promises to aid materially in the qualitative analysis of dust samples. The results of the test are available at the end of from twenty-four to forty-eight hours. The dust is very finely pulverized and inserted in a capillary glass tube. The properly filtered Ka radiation of a molybdenum target x-ray tube is used to produce a nearly monochromatic beam, which is passed through the contents of the capillary tube, producing diffractive effects identified on the film as bands of different density and intensity separated by areas of comparatively clear film. The blackening of the film occurs in bands, because these areas represent directions in which reinforcement of the roentgen energy occurs from diffractive interference while the clear areas show little blackening, owing to the fact that these areas relate to the aperiodic character of the roentgen energy diffracted in these directions. The quantitative amounts of sand or mica in a mixed dust sample of unknown character may be determined at least approximately by comparing the relative film densities of selected strong bands of the substance in the mixed sample with that of a known mixed control of the same substances.

Dermonecrotic Properties of *Staphylococcus Filtrates*

—Stookey and Scarpellino discuss the association of a dermo-necrotic, hemolytic and toxic filtrate obtained from toxin producing *staphylococci* and its relationship to certain diseases of the skin. They believe that pyoderma gangrenosa has much in common with osteomyelitis. In primary osteomyelitis the *staphylococcus* is blood borne from a primary focus usually situated in the skin, and after a varying period of pyemia it is embolically deposited in the bone, which produces the osteomyelitis. Pyoderma gangrenosa represents a reversal of this process. There is usually a primary focus, frequently hidden, from which the *staphylococcus* enters the blood at irregular intervals to be embolically deposited in the skin. To obtain *staphylococcus* toxin, the original culture should be made in sugar free mediums. Many strains of the *staphylococcus* are toxin makers, but on repeated subculture they lose their toxin-making properties, and, if the hydrogen ion concentration of the mediums is not adjusted properly, toxin formation will be inhibited or abolished. Animal passage will restore the original toxin making properties of the *staphylococcus*. The necrotic properties of the filtrate usually disappear before the hemolytic properties. This toxin has a marked antigenic action. Immune substances are carried in the pseudoglobulin fraction of the blood serum. Some observers consider that the hemolysin elaborated by several species of bacteria are identical. If this is true, anthelmolysins, due to hemoglobin-destroying organisms, should cross neutralize one another. The authors have worked with *staphylococci* obtained from three cases of vegetative bacterial endocarditis. The blood cultures were positive in all three cases for *Staphylococcus aureus*, which possessed hemolytic and dermo-necrotic properties. In nineteen cases of primary osteomyelitis *staphylococci* were isolated in all instances. Fifteen were found to have hemolytic properties and thirteen of these produced a dermo-necrotic toxin. Four cases of

cavernous sinus thrombosis, secondary to furuncles in the danger area, all showed dermo-necrotic and hemolytic toxin. From the pus obtained from fourteen furuncles, *staphylococci* have been isolated in all instances. Nine were found to be hemolytic and necrotic, three were hemolytic and nonnecrotic, and two lacked completely either hemolytic or necrotic properties. Cavernous sinus thrombosis seems to result from a *staphylococcal* infection in the anatomic area that drains into the skull, chiefly through the angular and ophthalmic veins. The primary lesion is usually a furuncle. There is a secondary thrombosis into the veins leading into the cavernous sinus, with an extension of the thrombus in the cavernous sinus.

Treatment of Lymphedema by Plastic Operation.

—Gillies and Fraser report a case of lymphedema of the lower extremities in which there was no evidence of acute lymphangitis, and although there were possible sources of infection the evidence for an inflammatory origin is not convincing. In view of the crippled condition of the patient and of the failure of all forms of treatment that had been tried, they attempted to restore lymph drainage from the legs to the trunk by means of grafts of skin and subcutaneous tissues so as to bridge the obstruction. The forearm could easily be brought close to the upper part of the thigh and, if two raw areas were made on the opposing surfaces, a large surgical union would take place, while, if the lymphatics also anastomosed, the lymph of the thigh would drain through the joint and be carried by way of the lymphatics of the arm into the general system, the block being thereby sidetracked. Four operations were carried out altogether. When the arm was joined to the thigh on the left side (first operation), the experimental lymphatic "tap" proved itself so efficient that the edema definitely subsided after three weeks and continued to do so after the patient had learned to hobble about. The other leg remained swollen. When the experimental operation was completed into a permanent plastic (fourth operation), the union of the two systems of lymphatics proved adequate to keep all discomfort and all swelling (except a small patch of the calf) from the operated leg after that date. Their experience appears to prove that a lymphatic tap below the obstruction is sufficient to cure the whole limb. It is desirable that some simpler "tap" than the arm-flap plastic should be discovered. The principle having been proved, simpler modifications of forming a bridge may suggest themselves.

Treatment of Bedsore with Elastic Adhesive Plaster.

—Carty successfully treated ten cases of bedsore by applying elastic adhesive plaster (elastoplast dressing). Fifteen days was the longest time taken for healing and no case proved intractable. No systemic reaction due to retention of discharge about the ulcer was observed. In carrying out the method, two pieces of elastic adhesive plaster, one over the other, are applied so that the bedsore and the skin surrounding it for at least an inch are covered. If the bedsore has a greater diameter than the bandage two pieces may be laid side by side and held together by two other pieces placed at right angles. The

bandage is left in position as long as it will adhere—usually, in the early stages when discharge is plentiful, from twelve to forty-eight hours. It is then replaced by similar pieces of adhesive plaster and repeated until healing is complete. On removal of the bandage no attempt should be made to clean the surface of the sore; it suffices to wipe away the discharge from the surrounding skin with absorbent cotton or a soft cloth before applying a new piece of bandage.

Infection with Yellow Fever Virus Following Instillation into Nares.—Findlay and Clarke state that the nasal instillation of neurotropic yellow fever virus in monkeys and mice is followed by the development of encephalitis; the virus also reaches the peripheral blood stream. The virus is present in the olfactory lobes of a monkey and in the cerebral hemispheres of mice two days after nasal instillation; later there is a general spread throughout the brain. Instillation of the virus in the conjunctival sacs of mice is followed in certain cases by encephalitis. Monkeys that have immune bodies to yellow fever present in the blood do not develop encephalitis after nasal instillation of the virus. The possible routes by which the virus reaches the brain from the nasal cavities are discussed.

The Ectopic Testicle.—Vines examined histologically forty-four cases of ectopic testicles of which thirty-eight showed unilateral and six bilateral misplacement. Unilateral and bilateral ectopic testicles are histologically distinct at and after puberty; before puberty no constant differences have been observed in equally immature testicles. After puberty the unilateral ectopic testicle undergoes progressive atrophy involving first and chiefly the spermatic epithelium and later the interstitial cells. In bilateral ectopia complete testicular atrophy does not occur; there is either normal spermatogenesis or else the spermatic tissue atrophies while the interstitial cells undergo marked hyperplasia. The atrophy of the spermatic tissue which may occur in both types of ectopia, is a result of puberty. It is probably due to the incapacity of the immature testicle to respond successfully to the stimulus of puberty. The interstitial hyperplasia in bilateral ectopia is also an effect of puberty and does not occur in the prepubertal period. The author suggests that bilateral ectopia and its associated malformations of the genitalia are not governed by the gonad but are parts of an endocrine syndrome that causes masculinization of the female in early fetal life.

 *Hernias of Mediastinum and Their Pathogenesis F Triboulet and J Lecœur—p 156

Besnier-Boeck's Disease.—Pautrier discusses in detail the clinical and pathologic manifestations of multiple benign saroid in various tissues. The cutaneous lesions, which have been the longest known, appear as nodosities of varying sizes. They develop slowly during years and may leave a central scar. The histologic picture is characteristic. They are formed of a dermal infiltration predominantly epithelioid and separated by narrow bands of collagen. Histiocytes and lymphocytes are frequently present. The infiltrating nodules border the hypoderm without producing the least reaction. The lesions in the ganglions, tracheobronchial glands, lungs, osseous tissue, viscera and nasal and conjunctival mucosa are histologically identical. The condition is therefore revealed as a generalized systemic disease primarily reticulo-endothelial. No agreement as to etiology has been reached. The consensus allies it with tuberculosis in an attenuated form. The author employs a treatment consisting of tuberculin and neosarsphenamine and has obtained many good results with it.

Hernias of Mediastinum.—Triboulet and Lecœur discuss the anatomic and functional factors concerned in mediastinal herniation. Two cases are reported. As a result of their studies they conclude that the pathogenic mechanism is not simple. It is usually due to pressing back of the pleural cul-de-sac through a weakened zone of the mediastinum owing to the simple influence of disequilibrium of pressures created by pneumothorax and manifesting itself through a maximum of expiratory distention. More rarely a different mechanism is involved in which the hernias are of maximum inspiration resulting from the aspirating action exerted by the opposite lung and are a simple manifestation of the retractable tendency of lesions at this site.

 *Prophylaxis of Measles with Adult Serum A S Levine—p 825

Prophylaxis of Measles.—Measles and its complications account for a high percentage of the infectious disease mortality. The struggle against measles according to Levine lies in the domain of general prophylaxis, hygiene and specific immunobiology. The immunizing action of adult serum may perhaps be explained in two ways: the presence of proteins and the presence of specific antibodies. He observed several groups of infants with various degrees of exposure and immunization to measles. He concludes that adult serum is a valuable prophylactic agent against measles. Convalescent serum has given brilliant results. Late introduction of serum has no results; early administration even of small quantities, often is advantageous. The introduction of serum lengthens the period of incubation. Large doses of serum (60 cc.) given in the first

days of the incubation period protect the child from the disease and give a passive immunity. Smaller doses of adult serum (from 15 to 20 cc), given up to the fifth day of incubation or larger doses given later, attenuate the disease and produce an active immunity. The author believes that only the passive immunization should be given to nurslings, the active method being reserved for older children.

Verification of Efficacy of Artificial Pneumothorax—Heudtlass and his collaborators assert that plane roentgenkymography is of great value in the verification of immobilization of the lung after artificial pneumothorax in pulmonary tuberculosis. They used a modification of Stump's technique by interposing between the patient and the film, in a vertical position, a grate with lead bars, opaque to the roentgen rays, 145 mm in width and 5 mm apart. The grate is slowly and uniformly displaced from left to right during respiration, by a special mechanism. The roentgenkymogram has a series of parallel vertical lines the interspaces of which represent the space covered by two openings in the grate. Motions in the lung are graphically registered, appearing in the interspace of the roentgenkymogram in the form of waves, following a horizontal direction and the amplitude of which depends on the intensity of the movement in the pulmonary field. Two waves are recorded by a pulmonary movement during two inspirations. The reading of the roentgenkymogram is made from left to right. If there is an abnormal image of the lung and the waves are synchronous to those given by diaphragmatic, costal or mediastinal movements, the movement of the pulmonary field is related to those organs. If, on the contrary, the waves do not coincide with those given by diaphragmatic, costal or mediastinal movements, the movement in the pulmonary field is independent of those organs.

- B Vitamins as Substitute for Insulin? W von Drigalski—p 1
Dyspeptic Disturbances in Patients with Chronic Cardiac Insufficiency D Branisteanu and I Fainita—p 15
Studies on Uric Acid Metabolism D Joffe—p 25

B Vitamins as Substitute for Insulin.—Von Drigalski reviews the literature of the action of vitamin B on the carbohydrate metabolism. The numerous reports which seemed to indicate that medication with vitamin B could be a substitute for insulin induced the author to treat with yeast ten cases of diabetes mellitus of various degrees of severity. Two patients were treated with fresh yeast (from 100 to 150 Gm) daily, while the other eight were treated with dry yeast. In order to determine the action of the yeast on the metabolism, the author studied the glycosuria, the blood sugar, the acidosis and the body weight. The tabular reports indicate clearly that yeast exerts no influence on glycosuria, acidosis, blood sugar content, insulin requirements and body weight of patients with diabetes mellitus and that consequently it cannot replace insulin in the treatment of diabetes mellitus. The author points out that the conditions in some of the animal experiments by which other investigators proved the influence of yeast on the carbohydrate metabolism correspond so little to the conditions in human diabetes mellitus that there is no necessity of discussing the contradictions between animal and human tests.

Dyspeptic Disturbances in Patients with Cardiac Insufficiency.—Branisteanu and Fainita point out that patients with decompensated heart disease are frequently subject to dyspeptic disturbances with loss of appetite, coated tongue, feeling of fullness after eating, heartburn, eructation, abdominal flatulence and constipation. The general opinion is that the stasis in the abdominal organs is the cause of these dyspeptic

disturbances. The stasis involves all abdominal organs, but the most noticeable symptoms of this stasis are those caused by the stomach and liver. For this reason the author studied in twenty-two patients with cardiac decompensation the roentgenologic and functional aspects of the stomach and the functional aspects of the liver. The patients were treated for several days with bed rest and digitalis, and after that the gastric mucous membrane was examined by roentgenography. Gastric juice was withdrawn and examined to determine the functional activity of the stomach. In order to determine the functional activity of the liver, the urine was examined for bilirubin and urobilinogen and the blood for lactic acid and bilirubin. The roentgenoscopy of the stomach revealed a swollen condition of the gastric folds, which may be interpreted as a manifestation of gastritis caused by stasis. Such changes in the gastric mucous membrane are generally found in postmortem examinations of patients with cardiac decompensation. An impairment of the liver was present in 81 per cent of the patients. The author concludes that the stasis gastritis and the insufficiency of the liver explain the dyspeptic disturbances in patients with cardiac insufficiency.

Diuretic Action of Complex Mercury Compounds II Gremels—p 186

Determination of Porphyrin by Means of Luminescence Test for Examination of Hepatic Function.—Franke and Fikentscher demonstrate that the quantitative determination of porphyrin by means of the luminescence method is an unusually exact test of the hepatic function. Even a simple overtaking of the normal activity of the liver cells and the slightest hepatic disturbances result in an increased elimination of the ether-soluble porphyrins in the urine, and the luminescence test clearly indicates this. A number of factors, to which formerly only slight importance was attached (expenditure of energy, constitution and nutrition), influence the porphyrin content of the urine. Thus the estimation of the porphyrin elimination has only clinical value, if these factors are taken into consideration. The diet should be given especial attention. In case of continuous tests, the patient should be put on a standard diet (restriction of meat and of proteins as well as of fats, with the exception of butter). The authors studied the modification of the porphyrin content of the urine by various diets. They observed an increase in the urinary porphyrin elimination not only following the intake of foods that contain porphyrin (exogenous porphyrin) but also after ingestion of large quantities of foods that tax the liver cells greatly. Especially the consumption of large quantities of fats (with the exception of butter) and of fats and proteins combined, results in a considerable increase in the urinary porphyrin elimination. The determination of the porphyrin content of the urine is thus helpful in estimating how the organism tolerates a certain type of diet.

Necessity of Caution in Use of Salyrgan?—Hug says that he would not like to dispense with a diuretic as effective as salyrgan in spite of the fatality caused by it in his hospital. He thinks that in every medicament which is administered intravenously a thrombosis is possible, but he considers this not a sufficient reason to reject the remedy entirely. It is a well known fact that patients with cirrhosis of the liver have an especially poor tolerance for intravenously administered remedies and the author points out that the patient who died following the administration of salyrgan not only had a severe cardiac myodegeneration but also cirrhosis of the liver. Moreover, it has been proved that the liver plays an important part in the action mechanism of salyrgan diuresis. In view of these facts the fatality observed by the author following the administration of salyrgan is the more understandable, and since he gained the impression that generally salyrgan is well tolerated by young

as well as by old patients and in administration into the muscle, the vein or the peritoneum he thinks that there is no reason to discontinue its use. He says that the considerable relief effected by salyrgan often induces the patients to request an injection.

Salyrgan as Diuretic in Severe Cardiac Weakness—According to Tziwanopoulos, most authorities agree that in severe cardiac insufficiency with a low maximum blood pressure and with myocardial changes a sudden artificial increase in the diuresis, which might cause a disturbance in the labile equilibrium of the circulation is to be avoided. He points out that the danger involved in the use of salyrgan in severe heart disease has been stressed repeatedly and that it has been recommended that the administration of salyrgan be preceded by a thorough digitalization.

 Treatment of Renovesical Tuberculosis T. Hryntschak—p. 114

Clinical Aspects of Carcinoma of Head of Pancreas—Hess and Falitschek call attention to the fact that the neoplasms developing in the head of the pancreas because of their spatial relation to the large bile duct, the pancreatic duct and the duodenum, are characterized by a number of symptoms, the concurrence of which makes a diagnosis possible. They describe one case of carcinoma showing the triad of typical symptoms: mechanical icterus with continuous complete acholia, continuous melena and Courvoisier's sign. Then they describe another case, in which the same syndrome was caused not by carcinoma but by cirrhosis of the pancreas. From this observation they conclude that the classic triad of symptoms does not permit a definite diagnosis of cancerous stenosis of the bile duct as long as ascites is absent. But, although the triad of symptoms lacks complete conclusiveness as regards a malignant process in the region of the bile passages, the intermittence of the biliary occlusion does not, as was formerly believed, indicate always a lithogenic closure but may occur also in the occlusion that results from malignant processes. The authors report a case history to illustrate this. They point out that, because of the nearness of the head of the pancreas to the duodenum, passage disturbances in this portion of the intestine may develop as the result of pancreatic carcinoma. In this connection they relate the clinical history of a man in whom during the beginning period of the cancer, incomplete duodenal stenosis without icterus was the main symptom. On the basis of this symptom an ulcerating process of the duodenum had been assumed at first. The authors stress that in patients of advanced age in whom roentgenoscopy reveals changes in the duodenum, the possibility of an incipient malignant growth of the pancreas should not be overlooked.

Histamine Action and How It Is Modified in Children

—Papp studied the pharmacologic action of histamine in children. He observed the general condition, the cutaneous symptoms, the blood pressure, the pulse, the formation of gastric juice, the pupillary reaction and the urine. He administered subcutaneously from 0.25 to 1 mg. of histamine. He observed various degrees of erythema, particularly in the face and at the site of injection. Increase in the temperature, headaches and tremors developed in many children. The formation of gastric juice was always greatly increased. However, histamine influenced neither the pulse nor the blood pressure. The author tried to inhibit or modify the action of histamine by various substances. He found that the administration of hypophyseal extract influences the erythema continuously and that epinephrine and dextrose influence the erythema slightly. The acid solutions of sodium phosphate and of sodium carbonate exert a hardly perceptible influence, and the solution of calcium exerts only a weak influence. The stimulating action exerted by histamine on the formation of gastric juice remains uninfluenced by any of the substances. Solution of sodium hydrocarbonate seems to increase further the action of histamine on the gastric juice.

- *Plasma Phosphatase in Normal and Rachitic Children O. Andersen—p. 5
 *Acute Barbitol Intoxication with Especial Regard to Organic Degenerations J. Ravn—p. 19

Plasma Phosphatase in Normal and Rachitic Children—Andersen's investigations in thirteen children aged up to 3 years, and twelve aged from 3 to 13, all without signs of rickets, showed average plasma phosphatase values of 0.25 in the first group, with boundary values from 0.14 to 0.34, and of 0.15 in the second group, with boundary values from 0.06 to 0.26. In twenty-five children, aged from 3 to 27 months, with typical signs of rickets, the average value was 0.86, with boundary values from 0.42 to 1.41. The lowest limit for beginning pathologic values is set at 0.30. Antirachitic treatment in rachitic children results in a reduction of the plasma phosphatase, the decrease being slow in comparison to the increase in calcium and phosphorus values and apparently following more closely the clinical improvement. No relation is apparent between the absolute phosphatase and calcium values, but a certain relation is seen between the phosphorus count and plasma phosphatase count, high phosphatase values usually appearing with low phosphorus values and vice versa. The absolute phosphatase value seems to be independent of the degree of the rickets. The establishment of increased phosphatase without simultaneous clinically demonstrable rickets may indicate latent D avitaminosis. Determination of the plasma phosphatase may perhaps be applied in confirming the optimal dose of vitamin D in the treatment of rickets.

Barbital Intoxication and Organic Degenerations—In the fatal case reported by Ravn, both liver and kidney degeneration were confirmed in the first twenty-four hours. The pancreas is thought possibly also to have been affected. He says that since liver insufficiency may occur in barbital intoxication, the use of dextrose in treatment is rational.

- *Eosinophilia After Intravenous Oil Injection J. Engelbreth-Holm—p. 29
 *Solitary Cecal Diverticula H. Thomsen—p. 45

Eosinophilia After Intravenous Oil Injection—Engelbreth-Holm's experiments in animals show that chaulmoogra oil does not have a positive eosinotoxic effect. Like any other oil it can, on intravenous injection, cause infarct formation in the lungs. Intravenous injection of oil irrespective of the kind of oil, will cause eosinophilia in the blood of rabbits. Since lung infarcts are the only pathologic process established in the animals with eosinophilia and since they are confirmed in all the animals with eosinophilia, the two changes are apparently related. In man a relation is seen between the blood eosinophilia observed after intravenous injection of chaulmoogra oil and the pulmonary changes analogous to those noted in animal experimentation. These changes or infarcts are not a specific chaulmoogra oil effect but are due to the fact that the substance is an oil.

Solitary Cecal Diverticula—Thomsen says that these diverticula are extremely rare and cites the eight cases found by him in the literature and presents three additional cases. The ages of the patients varied from 20 to 60. Solitary cecal diverticula (i. e., the cecal diverticula seen in patients not previously appendectomized) appear singly or at the most as two or three small pouches from the size of a pea to that of a walnut on the anterior wall of the cecum. The symptoms are identical with those of acute appendicitis, and the diagnosis in all the reported cases has been acute appendicitis. The danger of perforation seems to be greater in cecal diverticula than in appendicitis. Treatment has consisted in resection of the diverticulum itself or of the cecum. All the patients have recovered without any especial complications. Only one had perforation and peritonitis (Moschowitz).

CORRECTION

Use of Iron in Treatment of Pernicious Anemia—In the abstract of Mogensens article in THE JOURNAL, February 16, page 604 in the third line from the bottom, the words 'blood platelet production' should be replaced by 'red blood cell production'.
